Communities in Action National Academies of Sciences, Engineering, and Medicine 2017-04-27 In the United States, some populations suffer from far greater disparities in health than others. Those disparities are caused not only by fundamental differences in health status across segments of the population, but also because of inequities in factors that impact health status, so-called determinants of health. Only part of an individual's health status depends on his or her behavior and choice; community-wide problems like poverty, unemployment, poor education, inadequate housing, poor public transportation, interpersonal violence, and decaying neighborhoods also contribute to health inequities, as well as the historic and ongoing interplay of structures, policies, and norms that shape lives. When these factors are not optimal in a community, it does not mean they are intractable: such inequities can be mitigated by social policies that can shape health in powerful ways. *Communities in Action: Pathways to Health Equity* seeks to delineate the causes of and the solutions to health inequities in the United States. This report focuses on what communities can do to promote health equity, what actions are needed by the many and varied stakeholders that are part of communities or support them, as well as the root causes and structural barriers that need to be overcome.

Exploring the Biological Contributions to Human Health Institute of Medicine 2001-07-02 It's obvious why only men develop prostate cancer and why only women get ovarian cancer. But it is not obvious why women are more likely to recover language ability after a stroke than men or why women are more apt to develop autoimmune diseases such as lupus. Sex differences in health throughout the lifespan have been documented. *Exploring the Biological Contributions to Human Health* begins to snap the pieces of the puzzle into place so that this knowledge can be used to improve health for both sexes. From behavior and cognition to metabolism and response to chemicals and infectious organisms, this book explores the health impact of sex (being male or female, according to reproductive organs and chromosomes) and gender (one's sense of self as male or female in society). *Exploring the Biological Contributions to Human Health* discusses basic biochemical differences in the cells of males and females and health variability between the sexes from conception throughout life. The book identifies key research needs and opportunities and addresses barriers to research. *Exploring the Biological Contributions to Human Health* will be important to health policy makers, basic, applied, and clinical researchers, educators, providers, and journalists-while being very accessible to interested lay readers.

Orphan Lung Diseases Vincent Cottin 2023-04-11 The second edition comprehensively reviews the wide field of rare pulmonary diseases. Issues such as less common diseases affecting the airways, systematic disorders with lung involvement, interstitial lung diseases, and many other orphan conditions of the lungs are explored in this book. The progress and advances made in the field and the limited number of patients presenting each condition makes it very difficult for clinicians to be up-to-date in this field. Readers will discover how to diagnose and manage these rare orphan diseases. *Orphan Lung Diseases: A Clinical Guide to Rare Lung Disease* is a practical, informative book written by a team of international authors with much experience in rare pulmonary diseases. *Orphan Lung Diseases: A Clinical Guide to Rare Lung Disease*, second edition provides synthesized and easily accessible information about the main orphan lung diseases, to aid clinicians in charge of patients with rare disease, or who consider the diagnosis of a rare disease in their patient. It is a practical, informative guide written by a team of international experienced authors in rare pulmonary diseases.

Evaluation of the Benefits and Harms of Lung Cancer Screening with Low-dose Computed Tomography Rafael Meza 2021 IMPORTANCE: The U.S. Preventive Services Task Force (USPSTF) is updating its 2013 lung cancer screening recommendations. OBJECTIVE: To inform the USPSTF by evaluating the benefits and harms of low-dose computed tomography (LDCT) screening strategies by conducting simulation modeling; comparing strategies with varying starting and stopping ages, screening frequency, and eligibility criteria (based on smoking pack-years and years since quitting smoking or based on individual lung cancer risk); and identifying efficient strategies that provide the best balance of benefits (lung cancer deaths prevented and life-years gained [LYG]) and harms for a given level of LDCT screens. DESIGN, SETTING, AND PARTICIPANTS: Collaborative modeling with four lung cancer natural history models for individuals from the 1950 and 1960 birth cohorts from ages 45 to 90 years with no prior lung cancer diagnosis. EXPOSURES: Screening with LDCT with varying starting ages (45, 50, 55 years), stopping ages (75, 77, 80 years), and screening frequency (annual, biennial). Eligibility criteria based on either age, cumulative pack-years (20, 25, 30, 40 years) and years since quitting smoking (10, 15, 20, 25 years) (risk factor-based strategies) or age and individual lung cancer risk estimation using three established risk prediction models (Bach, Lung Cancer Death Risk Assessment Tool, and PLCOm2012) with varying risk thresholds for eligibility (risk model-based strategies). A total of 1,093 (289 risk factor-based and 804 risk model-based) strategies were evaluated. Full uptake and adherence for all scenarios were assumed. MAIN OUTCOMES AND MEASURES: Benefits: Lung cancer deaths averted and LYG compared with no screening per 100,000 population. Harms: Lifetime number of LDCT screens, false-positive results, biopsies, overdiagnosed cases, and radiation-related lung cancer deaths per 100,000 population. RESULTS: We identified a set of LDCT screening programs that are efficient and result in the most lung cancer deaths averted and LYG for a given level of screening (number of LDCT screens). Most efficient risk factor-based strategies start screening at age 50 or 55 years and stop screening at the age of 80 years. Most efficient risk factor-based strategies with at least 9 percent lung cancer mortality reduction have 20 pack-years as the minimum criterion for eligibility. The 2013 USPSTF-recommended criteria, which was selected based on lung cancer deaths averted using the 1950 birth cohort, is not among the efficient strategies for the 1960 birth cohort when considering both lung cancer deaths averted and LYG. However, annual strategies with the 20 pack-years minimum criterion, starting age of 50 or 55 years and stopping age of 80 years are efficient and result in increased screening eligibility (20.6% to 23.6% eligible) and considerably more lung cancer deaths averted (469 to 558 per 100,000) and LYG (6,018 to 7,596 per 100,000) than the 2013 USPSTF-recommended strategy (14.1% eligible, 381 lung cancer deaths averted and 4,882 LYG per 100,000). However these strategies also result in more false-positive tests (1.9 to 2.5 vs. 1.9 per person screened), overdiagnosed cases (83 to 94 vs. 69 per 100,000), and radiation-related lung cancer deaths (29.0 to 42.5 vs. 20.6 per 100,000) than the 2013 USPSTF-recommended strategy. The 20 pack-year strategies result in higher relative increases vs. the 2013 USPSTF-recommended criteria in eligibility, lung cancer deaths prevented, and LYG for women than men. These strategies also result in higher relative increases compared with the 2013 USPSTF-recommended criteria in eligibility for non-Hispanic blacks, Hispanics, and American Indian/Alaska Natives than for non-Hispanic whites and Asians. Among risk model-based screening strategies, the net benefits and harms of screening strongly depend on the risk model's specific risk thresholds. Risk model-based vs. risk factor-based strategies result in higher numbers of lung cancer deaths prevented and modest additional LYGs and induce fewer radiation-related lung cancer deaths; however, they result in more overdiagnosed cases. The general patterns observed for the 1960 birth cohort for men and women combined hold for each sex and for the 1950 birth cohort. LIMITATIONS: Simulations assumed 100 percent screening uptake and adherence. Relative performance of compared strategies might change if uptake and adherence differ by age or screening frequency. The models extrapolated results from short-term randomized trials with three LDCT annual screens to lifetime screening and followup. Simulations did not consider incidental findings and were restricted to the 1950 and 1960 U.S. birth cohorts. CONCLUSIONS AND RELEVANCE: This collaborative modeling analysis suggests that LDCT screening could lead to important reductions of lung cancer mortality and result in significant LYG when optimally targeted. In particular, screening individuals ages 50 or 55 years through 80 years with 20 or more pack-years of smoking exposure would result in more benefits than current criteria and would reduce disparities in eligibility by sex and race/ethnicity. Risk model-based screening strategies could result in higher benefits compared with risk factor-based screening strategies; however, the analysis did not consider issues of implementation and other potential challenges of risk model-based screening strategies.

Criminalizing Sex Stuart P. Green 2020 "Starting in the latter part of the 20th century, the law of sexual offenses, especially in the West, began to reflect a striking divergence. On the one hand, the law became significantly more punitive in its approach to sexual conduct that is nonconsensual or unwanted, as evidenced by a major expansion in the definition of rape and sexual assault, and the creation of new offenses like sex trafficking, child grooming, revenge porn, and female genital mutilation. On the other hand, it became markedly more permissive in how it dealt with conduct that is consensual, a trend that can be seen, for example, in the legalization or decriminalization of sodomy, adultery, and adult pornography. This book explores the conceptual and normative implications of this divergence. In doing so, it assumes that the proper role of the criminal law in a liberal state is to protect individuals in their right not to be subjected to sexual contact against their will, while also safeguarding their right to engage in (private consensual) sexual conduct in which they do wish to participate. Although consistent in the abstract, these dual aims frequently come into conflict in practice. The book develops a framework for harmonization in the context of a wide range of nonconsensual, consensual, and aconsensual sexual offenses (hence, the "unified" nature of the theory) -- including rape-as-unconsented-to-sex, rape-by-deceit, rape-by-coercion, rape of a person who lacks capacity to consent, statutory rape, abuse of position, sexual harassment, voyeurism, indecent exposure, incest, sadomasochistic assault, prostitution, bestiality, and necrophilia"--

This devastating disease takes strength not only in people who smoke but also in poor people that eat polluted food and use heating sources, and in those exposed naturally to toxic compounds present in indoor and outdoor environments. Lung cancer patients and their families wait actions from the science that give not only answer to their demands but also a light of hope at the moment of receiveing the diagnosis. This book meets the experience of several researchers who dedicate many hours a day to find not only the cure of lung cancer but also the way to convert the pathology of this chronic disease. In 12 chapters, the lectures will give information related to the relationship of lung cancer and smoking habit, the crucial role of the image technology for diagnosis of lung cancer, and a molecular vision of prevention, diagnosis, and treatment of lung cancer. The authors with a clinic and/or lab vision and with a great spirit to collaborate with the science and with each past, present, and future patient and their families have dedicated many hours to write each chapter. Probably, the final answer to find the cure of lung cancer is not in this book. However, the lectures will give scientific information that will contribute in the near future improvement to the life quality of the patients.

Educating the Student Body Institute of Medicine 2013-11-30 Physical inactivity is a key determinant of health across the lifespan. A lack of activity increases the risk of heart disease, colon and breast cancer, diabetes mellitus, hypertension, osteoporosis, anxiety and depression and others diseases. Emerging literature has suggested that in terms of mortality, the global population health burden of physical inactivity approaches that of cigarette smoking. The prevalence and substantial disease risk associated with physical inactivity has been described as a pandemic. The prevalence, health impact, and evidence of changeability all have resulted in calls for action to increase physical activity across the lifespan. In response to the need to find ways to make physical activity a health priority for youth, the Institute of Medicine's Committee on Physical Activity and Physical Education in the School Environment was formed. Its purpose was to review the current status of physical activity and physical education in the school environment, including before, during, and after school, and examine the influences of physical activity and physical education on the short and long term physical, cognitive and brain, and psychosocial health and development of children and adolescents. Educating the Student Body makes recommendations about approaches for strengthening and improving programs and policies for physical activity and physical education in the school environment. This report lays out a set of guiding principles to guide its work on these tasks. These included: recognizing the benefits of instilling life-long physical activity habits in children; the value of using systems thinking in improving physical activity and physical education in the school environment; the recognition of current disparities in opportunities and the need to achieve equity in physical activity and physical education; the importance of considering all types of school environments; the need to take into consideration the diversity of students as recommendations are developed. This report will be of interest to local and national policymakers, school officials, teachers, and the education community, researchers, professional organizations, and parents interested in physical activity, physical education, and health for school-aged children and adolescents.

Good Health & Great Sex After 40 M. Stenchever 1998-09-04 Until this century few women lived past the age of menopause, and the problems of living in an aging body had minimum social significance or interest. With improvement of health care and general benefits of modern society, however, the average life expectancy for a woman is now over age 80. It is therefore important to help women stay as healthy as possible for as long as possible in order to derive the greatest benefits of what life has to offer. This book focuses on wellness and helps women to understand the potential problems of an aging body and the ways in which they can modify their habits and activities to get the most out of life for the longest period of time. It offers both scientific information and common sense, derived from the author's years of experience as an academic gynecologist. It addresses topics involving the biological changes that occur in aging, effecting gives Preventive health care advice on nutrition, the use of vitamin supplements, exercise, immunizations, and indicates what a woman can expect from an annual examination by a physician. Problems of the menopause and hormone replacement therapy are also considered, as are important social issues such as sexuality, loss and grief, dealing with a chronic illness, and dealing with situations of abuse.
