The Health of Lesbian, Gay, Bisexual, and Transgender People - Institute of Medicine 2011-06-24

At a time when lesbian, gay, bisexual, and transgender individuals—often referred to under the umbrella acronym LGBT—are becoming more visible in society and more socially acknowledged, clinicians and researchers are faced with incomplete information about their health status. While LGBT populations often are combined as a single entity for research and advocacy purposes, each is a distinct population group with its own specific health needs. Furthermore, the experiences of LGBT individuals are not uniform and are shaped by factors of race, ethnicity, socioeconomic status, geographical location, and age, any of which can have an effect on health-related concerns and needs. *The Health of Lesbian, Gay, Bisexual, and Transgender People* assesses the state of science on the health status of LGBT populations, identifies research gaps and opportunities, and outlines a research agenda for the National Institute of Health. The report examines the health status of these populations in three life stages: childhood and adolescence, early/middle adulthood, and later adulthood. At each life stage, the committee studied mental health, physical health, risks and protective factors, health services, and contextual influences. To advance understanding of the health needs of all LGBT individuals, the report finds that researchers need more data about the demographics of these populations, improved methods for collecting and analyzing data, and an increased participation of sexual and gender minorities in research. *The Health of Lesbian, Gay, Bisexual, and Transgender People* is a valuable resource for policymakers, federal agencies including the National Institute of Health (NIH), LGBT advocacy groups, clinicians, and service providers.

Written by an acclaimed contributor to the field, *Sexual Aspects of Cardiovascular Disease* provides health professionals with presently available information on the sexuality of these patients, their concerns and problems, the impact of pathophysiologic and psychological factors, and the need for comprehensive sexual counseling. The volume addresses sexual aspects involved in patients with coronary artery disease, hypertension, congenital heart disease, valvular heart disease, aorto-iliac occlusive disease, as well as coronary by-pass surgery, heart transplant, and stroke patients. The safety and desirability of childbearing is studied as well as the interrelationships of sexual function and cardiovascular drugs. Sexual counseling of the patient and spouse is one component of comprehensive cardiac care. This volume will enhance the clinician's ability to provide this guidance. Topics discussed include: sex and the non-coronary cardiac patient; quality of life and sexual activity after cardiac surgery; sex and stroke patient; cardiovascular drugs and sexuality. Health professionals, persons suffering from cardiovascular disease, or anyone who knows someone with a cardiovascular disease will benefit from Dr. Papadopolou's in-depth study.

Sex differences in atherosclerosis and exercise effects - Liam Ward 2019-04-17

Cardiovascular disease (CVD) is the leading cause of death globally, with atherosclerosis being the main cause of cardiovascular diseases. Atherosclerosis is an inflammatory disease of the blood vessel wall, which over time will cause thickening and hardening of the vessel wall. Atherosclerosis can result in catastrophic vascular events, such as myocardial infarction and stroke. There are distinct sex differences in CVD mortality at different ages, before menopause women have a lower mortality of CVD in comparison to men, which equalises after menopause. In addition to sex differences in the incidence of CVD, there are also distinct sex differences in the phenotype of atherosclerotic plaques, with men generally developing more severe and vulnerable plaques that are at risk of rupture. This thesis aimed to investigate the sex differences in atherosclerosis, in particular how the proteome and pathophysiology differs. In addition, we sought to investigate the potential benefit of an exercise programme, in reducing CVD risks, using a randomised controlled trial including postmenopausal women. Sex differences in atherosclerosis were first investigated via proteomic analysis of human carotid endarterectomy samples. Initially, five intraplaque biopsies were taken from distinct atheroma regions, including; internal control, fatty streak, plaque shoulder, plaque centre, and fibrous cap. Protein extracts from these biopsies were subjected to analysis by mass spectrometry. The novel sampling method was successful in reducing the effect of plaque heterogeneity, a limitation in previous proteomic studies of atherosclerosis, and a number of previously unreported proteins were identified in human carotid atheroma. In addition to this, with the inclusion of multivariate statistical modelling, it was found that 43 proteins significantly discriminated the carotid atheroma between men and women. These proteins were grouped by function, and it was found that atheroma from men was associated with the increased abundance of inflammatory response proteins, including phospholipase-A2 membrane associated and lysozyme C, and atheroma from women was associated with increased abundance of blood coagulation, complement activation, and transport proteins, notably including; antithrombin-III, coagulation factor XII, and afamin. In addition, differences were also observed in the abundance of iron metabolism related proteins. These sex differences were further expanded upon from a pathophysiological perspective. Immunohistochemistry stainings of ferritin and transferrin receptor 1 were found significantly increased in the atheroma from men. Moreover,

the levels of plasma haemoglobin were also significantly increased in men and were associated with the development of more vulnerable and severe plaque types. The more vulnerable and severe plaque types were also associated with significantly greater macrophage infiltration. In summary, these results are indicative of men developing atheroma with greater inflammation that are more vulnerable, due to increased iron and inflammatory proteins and macrophage infiltration, whereas atheroma from women develop with less inflammation and a more stable phenotype. The randomised controlled clinical trial aimed at investigating the effects of resistance training (RT), over a 15-week period, in postmenopausal women. Plasma samples were obtained at week-0 and week-15 of the study period, and analyses were performed primarily using a series of immunoassays. Results showed that women participating in RT, with good compliance, were associated with significant decreases in plasma levels of ferritin, lipids, and inflammatory adipokines. These results suggest that the use of regular RT may be a beneficial intervention in reducing the levels of body iron, lipids, and inflammation, all of which are risk factors for the development of CVD. However, validation studies are required in a larger cohort of postmenopausal women, in addition to the inclusion or complementary studies in middle-aged men. In summary, the works included in this thesis further expand on the current knowledge of sex differences in atherosclerosis, and also provides information on the potential of an exercise intervention to beneficially reduce the effects of known risk factors of CVD.

Sex-Specific Analysis of Cardiovascular Function - Peter L. M. Kerkhof 2018-07-26

This book gathers together contributions from internationally renowned authors in the field of cardiovascular systems and provides crucial insight into the importance of sex- and gender-concepts during the analysis of patient data. This innovative title is the first to offer the elements necessary to consider sex-related properties in both clinical and basic studies regarding the heart and circulation on multiscale levels (i.e. molecular, cellular, electrophysiologically, neuroendocrine, immunoregulatory, organ, allometric, and modeling). Observed differences at (ultra)cellular and organ level are quantified, with focus on clinical relevance and implications for diagnosis and patient management. Since the cardiovascular system is of vital importance for all tissues, Sex-Specific Analysis of Cardiovascular Function is an essential source of information for clinicians, biologists, and biomedical investigators. The wide spectrum of differences described in this book will also act as an eye-opener and serve as a handbook for students, teachers, scientists and practitioners.

Cardiovascular Disease - Christine Langhoff 2003-06-07

Essay from the year 2003 in the subject Medicine - Internal Medicine, grade: 1.1 (A+), Oxford University (New College), 3 entries in the bibliography, language: English, abstract: Cardiovascular disease is the leading cause of death worldwide and therefore many scientists are interested in finding both ways to prevent and to treat it. It is a multifactorial disease and thus is being influenced by a variety of environmental and genetic factors and therefore it is difficult to establish the most important risk factors involved in the development of the disease. The term risk factor describes those characteristics found, in healthy individuals, to be independently related to the subsequent occurrence of cardiovascular disease and, where modifiable, to be reversible. This term includes modifiable lifestyle and biochemical and physiologic characteristics as well as nonmodifiable personal characteristics such as age, sex, genetic makeup, early life influences and family history of premature cardiovascular disease. When a person develops cardiovascular disease, the modifiable risk factors continue to contribute to the progression of the disease and prognosis. Risk factors include smoking, hypertension, changes to lipid levels (e.g. raised total cholesterol), raised blood glucose, obesity, family history of premature

cardiovascular disease, female hormonal status, dyslipidemia, diabetes, etc. Except for female hormonal status, no risk factor has been recognised as acting on one gender but not on the other. [...]

Special Issues in Hypertension - Adel E. Berbari 2012-12-22

This book is not intended as a full detailed report on hypertension and related disorders, but instead focuses on particular issues in hypertension. It looks at emerging recently described forms of hypertension that are frequently encountered in clinical practice (prehypertension, white-coat and masked hypertension, hypertension in the elderly) and discusses novel aspects of target organ disease (for example, cognitive impairment, dementia, and sexual dysfunction), and changing concepts in the management of hypertension and antihypertensive pharmacotherapy. It also looks at specific topics that are rarely discussed in books, including hypertension control in postmenopausal women on hormonal replacement therapy, Ramadan fasting, painful inflammatory disorders, and aldosterone escape. Finally, it examines newer cardiovascular risk factors (for example, uric acid, circadian blood pressure changes, blood pressure variability).

Hypertension and Cardiovascular Disease - Emmanuel A. Andreadis 2016-09-20

This book provides comprehensive analysis into individualized patient care, and applying evidence-based medicine while integrating basic medical knowledge with applied medicine. The Editor and the contributors not only discuss important issues on hypertension management and its deleterious consequences if it is not well-controlled, but also highlight the important signaling pathways involved in the pathogenesis of hypertensive heart disease and cardiac hypertrophy.

Sildenafil - Udo Dünzendorfer 2004-10-25

This drug is a landmark discovery, which consequently has become the definitive therapy for the treatment of erectile dysfunction (ED). Following the major breakthrough in the field of nitric oxide (NO)-physiology and pharmacology leading to sildenafil being marketed, the most current information is presented in this reference book, including ongoing research from several disparate groups about NO as endothelium-derived relaxing factor (EDRF) and also as a neurotransmitter for nerves innervating erectile tissue in mammals. The development of sildenafil as an oral phosphodiesterase-5 (PDE5) inhibitor drug for the treatment of ED resulted in one of the first products, which made its way successfully from basic NO research to routine clinical therapy. This volume addresses all fields of sildenafil application in both men and women. In a highly competitive research environment with a critical medical need for drug improvements the reader will learn more about clinical resistance to sildenafil treatment and the modalities to overcome the failure rates. The individual chapters cover clinical use, pharmacokinetics, pharmacodynamics, biochemistry, and cultural aspects. They are written by leading experts in their respective fields. Therefore, readers a?? whether professionals in the pharmaceutical industry, physicians treating ED, biochemists, chemists or pharmacologists a?? will find a detailed and up-to-date knowledge base about current research activities and an excellent overview for further research on this compound class and its cultural impact.

[Sex Differences in Heart Disease](#) - Bohuslav Ostadal 2021-11-16

Cardiovascular diseases are the leading cause of mortality in men and women. Unfortunately, women have traditionally been excluded from clinical trials, and female animals have been used less or sex was not reported in basic research studies. Until recently, consideration of both sexes was not required in clinical and preclinical studies focusing on cardiovascular diseases. However, the number of clinical and experimental papers dealing with sex differences and heart disease significantly increases during the last years. This trend is obviously the result of at least two facts: the number of examples of different behavior of the male and female heart under physiological and pathological conditions is steadily increasing and there were controversial reports on the beneficial and adverse effect of hormonal replacement therapy. Detailed molecular and cellular mechanisms of these differences are still unknown but one is clear already today: sex differences are so important that they should be considered by the selection of optimum diagnostic and therapeutic procedures in clinical practice. The book presents 16 manuscripts on sex differences of heart disease, as developed by several investigators; the volume is organized in four parts. Part I, dealing with sex differences in cardiac ischemic injury, includes 5 chapters on experimental aspects of cardiac ischemia/reperfusion injury, the role of testosterone, and clinical aspects of ischemic heart disease. Part II is devoted to sex differences in heart failure and includes four chapters. Discussion in this part of the book is centered around the sex differences in heart failure due to volume overload. Part III of this volume includes four papers on risk factors of cardiovascular diseases, namely hypertension and obesity, and, finally, three chapters in part IV deal with sex differences of cardiac mitochondria under different pathological conditions. We believe this book will be very useful for cardiovascular scientists, graduate students, postdoctoral fellows and other health professionals.

Cardioprotection - Derek Hausenloy 2009-08-20

Coronary heart disease (CHD) is the leading cause of death worldwide with 3.8 million men and 3.4 million women dying each year.

Cardioprotection refers to the prevention of CHD and the clinical improvement in patients suffering from cardiovascular problems. This book focuses on the role of cardioprotection in surgery and the use of pharmacological therapies such as ACE-inhibitors, statins and beta-blockers in order to reduce the myocardial injury sustained by the patient and the significant risk of morbidity and mortality. It includes new cardioprotective strategies aimed at improving the clinical outcomes of patients in these settings, as well as current well-established methods for reducing myocardial injury in acute coronary syndrome patients.

Emotional Aspects of Heart Disease - Harold Geist 1976

Heart Disease and Erectile Dysfunction - Robert A. Kloner 2004-03-05

It is now generally appreciated that heart disease and its attendant risk factors are a leading cause of erectile dysfunction (ED) and that ED is often an early warning sign of vascular disease. In *Heart Disease and Erectile Dysfunction*, senior physicians, cardiologists, urologists, psychologists, and pharmacologists critically review the relationship between heart disease and erectile dysfunction and explain for the practicing physician the effective new treatment options available for the cardiac patient with ED. The authors detail in concise language the latest thinking about the risk of sexually induced cardiac events, the efficacy and risks to cardiac patients of drugs used to treat sexual dysfunction, and the expert guidelines developed by prominent organizations on the optimal approach to sexual dysfunction in the cardiac patient. They also discuss the physiology of ED and how the currently available therapies (sildenafil, tadalafil, and vardenafil) may interact with the cardiac system, and the potential application of newer phosphodiesterase-5 inhibitors to cardiovascular disease. Comprehensive and pathbreaking, *Heart Disease and Erectile Dysfunction* not only clearly delineates for practicing physicians all aspects of the interaction between the vascular system and erectile dysfunction, but also establishes a sound medical basis for the management of cardiac patients suffering erectile disorders. [Gender Differences in the Pathogenesis and Management of Heart Disease](#) - Jawahar L. Mehta 2018-03-02

This book reviews all aspects of the diagnosis and management of heart disease in women, covering areas such as gender differences in metabolic syndrome, hypertension and atherogenesis. Gender differences in cardiovascular diseases are widespread, but while gender medicine takes into account the effects of sex and gender on the health of women and men, traditionally, women have been underrepresented in cardiovascular clinical trials, in management of different cardiac diseases and drug use. *Gender Differences in the Pathogenesis and Management of Heart Disease* deals with the gender-specific differences in cardiac physiology and diseases and brings into perspective the critical significance of gender in management of cardiovascular disease presentations and management. As such it is of enormous use to all clinical staff who manage women with cardiovascular disease.

Biology of Women's Heart Health - Lorrie Kirshenbaum 2023-12-20

Cardiovascular disease (CVD) is the leading cause of morbidity and mortality in women and men worldwide and represents a major financial burden to world health care systems. Importantly, CVD has eclipsed cancer as the leading cause of death for women globally. Through advancements in research and clinical testing, the symptoms and risk factors for CVD have been well established for men, but not for women. Consequently, there is an immediate need for new innovative research that will bridge this gap and allow for improved early diagnosis and treatment of CVD in women. This book will serve as a guide for health care providers to better understand the physiological, biochemical, and genetic differences in heart disease in women with the goal of providing improved education, awareness and treatment of cardiovascular disease in women. The book will cover topics such as: sex dependent clinical outcomes of cardiovascular disease, cardiac protection by estrogen, cardiac health during menopause, cardiac rehabilitation programs, fitness and exercise, cardio-oncology, shift work and the CVD risk, and pregnancy related CVD.
