Developmental Genetics Gurbachan S. Miglani 2013-12-30

Development is behind what one looks like. It is directed by genes, the units of heredity, which are made up to deoxyribonucleic acid (DNA) in all animals (including man), plants, microorganisms and most of the viruses except in some viruses where ribonucleic acid (RNA) is the genetic material. Developmental Genetics integrates the two disciplines of development and genetics into one. Key Features: Each chapter begins with a brief introduction and historical background. The text explains both classical and recent material. Various phenomena of developmental genetics explained with examples of animals, plant, bacteria and viruses. Text explained with suitable examples, illustrations, tables and figures. List of references and review questions given at the end of each chapter Exhaustive glossary, author index and subject index given at the end of the book. This book is essential reading for postgraduate in developmental genetics, teachers teaching this subject and developmental biologists conducting research in this area. It is also suitable for candidates preparing for ARS/UGC NET examination.

Hereditary Bone and Joint Diseases in the Dog Joe P. Morgan
2000 This book provides unique material that goes far beyond a description of bone and joint disorders alone. Each chapter provides information on the history, pathogenesis, diagnosis (physical and radiographic), therapy and prognosis of a particular canine skeletal disease as well as how the disease will affect the dog's life. The text covers all clinically relevant physical regions in the dog, eg, shoulder, elbow, hip, stifle and tarsus, and presents a group of actual, clinical osteochondrosis cases involving different anatomical locations. The authors address the importance of selection of dogs for breeding, including changes in breed appearance and disease propensity and the effect of high-energy diets in fast-growing animals. Discussion includes the impact of a lifetime of pain for the affected dog and the treatment expense for clients, yet provides steps that help the owner curb the progressive aspects of bone or joint diseases and manage the animal's discomfort. In daily practice client questions about skeletal disorders are routine. This remarkable, instructional text will provide answers, incidence figures, advice about surgery and timing, and honest analyses of treatment failures and successes. Here is a fresh look at OCD, dysplasias and other bone diseases, with realistic assessments and positive directives for pet care and client support. Dog behaviour Ann-Sofie Sundman 2019-04-17 Dogs, *Canis familiaris*, share the lives of humans all over the world. That dogs, and the behavior of dogs, are of interest to many is therefore no surprise. In this thesis, the main aim has been to identify factors that affect dogs' behaviours. The dog, *Canis familiaris*, is our first domesticated animal. Since domestication, various types of dogs have developed through adaptation to an environment shared with humans and through our selective breeding, resulting in a unique variation in morphology and behaviour. Although there is

Downloaded from
legacy.opendemocracy.net
on 2023-05-18 by guest

an individual variation in the behaviour of dogs, there is also a difference between breeds. Moreover, selection during the last decades has split some breeds into divergent types. Labrador and golden retrievers are divided into a common type, for show and companionship, and a field type, for hunting. By comparing the breed types, we can study the effects of recent selection. In Paper I, we investigate differences in general behavioural traits between Labrador and golden retriever and between common and field type within the two breeds by using results from the standardized behaviour test Dog Mentality Assessment. There were differences between breeds and types for all behavioural traits. However, there was also an interaction between breed and type. Thus, a common/field-type Labrador does not behave like a common/field-type golden retriever. Even though they have been selected for similar traits, the selection has affected the general behavioural traits differently in the two breeds. In paper II, we were interested in dogs' human-directed social skills. Dogs have a high social competence when it comes to humans. Two experiments commonly used to study these skills are the problem-solving test, where dogs' human-directed behaviours when faced with a problem are measured, and the pointing test, where dogs are tested on how well they understand human gestures. We compared the social skills of German shepherds and Labrador retrievers, and of common- and field-type Labradors. Labradors were more successful in the pointing test and German shepherds stayed closer to their owners during the problem solving. Among Labrador types, the field type had more human eye contact than the common type. Importantly, when comparing the two experiments, we found no positive correlations between the problem-solving test and the pointing test, suggesting that the two tests measure different aspects of human-directed social behaviour in dogs. A previous study has identified two suggestive genetic regions for human-directed social behaviours during the problem-solving test in beagles. In paper III, we show that these

SNPs are also associated to social behaviours in Labrador and golden retrievers. Moreover, the Labrador breed types differed significantly in allele frequencies. This indicates that the two SNPs have been affected by recent selection and may have a part in the differences in sociability between common and field type. The behaviour of dogs cannot simply be explained by genetics, there is also an environmental component. In paper IV, we study which factors that affect long-term stress in dogs. Long-term cortisol can be measured by hair samples. We found a clear synchronization in hair cortisol concentrations between dogs and their owners. Neither dogs' activity levels nor their behavioural traits affected the cortisol, however, the personality of the owners did. Therefore, we suggest that dogs mirror the stress level of their owners. The mediator between genes and the environment is epigenetics, and one epigenetic factor is DNA methylation. In paper V, we compared methylation patterns of wolves and dogs as well as dog breeds. Between both wolves and dogs and among dogs there were substantial differences in methylated DNA regions, suggesting that DNA methylation is likely to contribute to the vast variation among canines. We hypothesize that epigenetic factors have been important during domestication and in breed formation. In this thesis, I cover several aspects on how dogs' behaviours can be affected, and paint an intricate picture on how genetics, epigenetics, and human-dog relations forms dog behaviour.
