Sexually Transmitted Diseases Rosanna Peeling 2008-02-01 In recent years, molecular techniques have enhanced our ability to detect sexually transmitted infections and to conduct research to further our understanding of sexually transmitted diseases. Molecular methods to quantitate pathogen load have also been shown to be useful for the management of HIV and other viral STDs. Existing laboratory manuals for the clinical microbiology

laboratory often do not include molecular methods for STDs. Sexually Transmitted Diseases: Methods and Protocols is intended to fill the need for a dedicated manual that covers all the fundamental aspects of molecular protocols for laboratory diagnosis, as well as research methodology for STDs, including HIV. There are more than types of molecular techniques described in this book covering nine major sexually transmitted pathogens. Although molecular methods for the detection of such pathogens as *Trichomonas vaginalis* are available in the published literature, they have not been included since they are not yet widely used for laboratory diagnosis or research. Sexually Transmitted Diseases: Methods and Protocols is one of a series of books treating Methods Molecular Medicine, published by Humana Press.

Sexually Transmitted Infections in HIV-Infected Adults and Special Populations Laura Hinkle Bachmann 2017-06-13 Though recent breakthroughs in research advance care with each day, the population of HIV-infected individuals continues to grow globally, leaving them particularly susceptible to additional STDs that are complicated by their immunocompromised state. This

text is the only book to provide a comprehensive and state-of-the-art review of issues relevant to STI care in the HIV-infected adult, adolescent, and transgendered populations. Written by experts in the field, HIV in HIV-Infected Adults and Adolescents approaches these unique needs through its review of sexual history, synergies between STIs and HIV, epidemiology, issues specific for HIV-infected individuals, clinical presentation, diagnosis and management considerations for ten common STIs, and prevention strategies. Each topic includes a case-based presentation and the most current CDC-recommended STI treatment regimens. Sexually Transmitted Infections in HIV-Infected Adults and Special Populations is the ultimate resource for any physician treating adults and special populations with HIV, including HIV clinicians, sexual health specialists, general internists, family medicine practitioners, infectious diseases specialists, advanced practice clinicians, and physicians.

Guidelines for the management of symptomatic sexually transmitted infections World Health Organization 2021-07-15
The WHO global health sector strategy on sexually transmitted infections, 2016–2021, endorsed by the World Health Assembly in 2016, aims to eliminate STIs as a public health threat by 2030. In 2019, WHO published estimates of new cases of chlamydia, gonorrhoea, syphilis and trichomoniasis. Recent changes in the epidemiology of STIs and progress in prevention, diagnosis and treatment of STIs and HIV have necessitated changes in approaches to STI prevention and management. To address these STIs, the most widely used approach in clinical settings is the syndromic management of STIs. In most resource-limited settings, the syndromic management flow charts are still the standard of care where laboratory diagnosis is not available or is hard to access. The objectives of these guidelines are to provide updated, evidence-informed clinical and practical recommendations on the case management of people with symptoms of STIs; and to support countries in updating their

national guidelines for the case management of people with symptoms of STIs. These guidelines include the management of symptomatic infections related to urethral discharge syndrome, including persistent urethral discharge syndrome; vaginal discharge syndrome, including persistent vaginal discharge; anorectal infection; genital ulcer disease syndrome; and lower abdominal pain syndrome. These guidelines are intended for programme managers for STI prevention and control at the national level and the health-care providers at the frontline – primary, secondary and tertiary health care.

Sexually Transmitted Diseases in Homosexual Men David G. Ostrow 2013-11-11 This book is intended to educate the primary health care provider about sexually transmitted and related diseases as they present in homosexually active men. But why a book discussing sexually transmitted diseases (STDs) in this population only? Surely STDs are not limited to homosexual males. The relatively high rates of incidence of many of these diseases among homosexually active men, however, and the large number of associated diagnostic and treatment problems have necessitated the collection into one volume of the information that is par ticularly relevant to the primary health care of this population. A book dealing with current trends in the diagnosis and treatment of sexual diseases can, by nature of the task, be

neither encyclopedic nor all-encompassing. In this volume, the choice of disease entities and the amount of material included on each are based on consideration of the amount of current information and the relative degree of uniqueness of a given problem in homosexual men, rather than the absolute frequency of the disease. There is, therefore, a considerable amount of material on hepatitis B and gonococcal infections, reflecting the recent explosion of research and clinical investigation in these two areas. In contrast, little is said about nonspecific urethritis, chancroid, and lymphogranuloma venereum. In the case of nonspecific urethritis, although it is extremely common in homosexual men, little progress has been made in diagnosis or therapy.

Novel Approaches to Testing for Sexually Transmitted Infections, Including HIV and Hepatitis B and C in Europe

European Centre for Disease Prevention and Control 2012

Testing strategies are central to the control of sexually transmitted infections (STIs), human immunodeficiency virus (HIV) and hepatitis B and C. Accurate testing enables treatment of those infected and subsequent reduction in infectiousness, reduced clinical consequences, identification as well as treatment of potentially infected partners and opportunities for health promotion and behaviour modification due to awareness of infection. Nonetheless, there is huge variation in the availability of current routine diagnostic tests within Europe. Recent changes in the field of testing for STIs, HIV, hepatitis B virus (HBV) and hepatitis C virus (HCV) include the widespread implementation of nucleic acid amplification technologies (NAATs) for chlamydia and gonorrhoea diagnosis and the development of HIV screening tests that are easy to use and give a result almost immediately. Such technological advances can open up opportunities for more accurate, near-patient testing, provision of

rapid results, or noninvasive sampling. Developments in communication technology in recent years have enabled the emergence of ehealth (electronic-health) and m-health (mobile-health) activities. A framework was developed to structure and categorise the advances and novel approaches, consisting of i) test technical principle and biological sample, ii) person-context, and iii) information cascade, together with the crosscutting themes of evaluation, regulation and quality control and quality assurance. A literature search was conducted using broad search criteria for recent publications from European countries, the United States, Canada and Australia. Further information and examples were obtained from grey literature and online searches and input from experts.^^Amplification, molecular techniques and non-amplification techniques such as lateral flow have been applied to test for a wide range of infections. Nucleic Acid Amplification Technologies (NAATs) tests offer accurate diagnosis, while lateral flow and flow-through tests require limited equipment, ease of use and can give results almost immediately. Rapidity together with the accuracy of molecular diagnostics has been made possible with the advent of microfluidic and nano-based NAATs technologies. Tests for chlamydia and gonorrhoea, and HIV viral load are in development. Microfluidic and nano-based technologies use very low reagent volumes which improve efficiency, reduce costs and increase portability. Non-amplification point of care (POC) tests for HIV based on lateral flow and flow-through principles have been extensively evaluated and implemented in service provision.^They enable screening results to be given to participants within 30 minutes and hence delivered at the same visit. However, development of POC devices and particularly any future self-testing devices will be challenged by the need for simple methods to collect the biological sample and apply it to the device, with minimal sample processing by the user to minimise operator error. Expanding testing for STIs, HIV, HBV and HCV to

healthcare settings outside specialist health care services and community services can be used to expand access to testing and to target key populations. HIV and chlamydia testing are leading the way in moving testing to these types of venue. A systematic review reported that HIV testing in community settings can be successful in diagnosing previously undiagnosed HIV infections in many most at-risk populations, and is acceptable to both the target group and staff undertaking the tests.^^The use of the internet for recruiting young people or other target groups to test for STIs is considered to be the most innovative method of offering home-testing, offering convenience and privacy through postal receipt of kits while not limiting the target population by geographical location or the necessity of being registered with a healthcare organisation, school or other list. It is now common practice in many settings to disseminate results by SMS message, considerably reducing staff time for giving out results and managing clinic workload. An effective component of STI control strategies is partner notification and treatment: and there are a number of examples of internet tools which have been developed with the aim of helping both provider-led and patient-led partner notification. Evaluations of new diagnostics and new approaches to testing are required to ensure effective and cost-effective use and implementation of novel technologies and approaches.^Diagnostic devices are regulated at the EU-level under the Directive 98/79/EC of the European Parliament and of the Council of 27 October 1998 on in vitro diagnostic (IVD) medical devices, and the Commission Decision of 3 February 2009 amending Decision 2002/364/EC on common technical specifications for IVD medical devices. Although there are minimum performance standards for devices to detect HIV, HBV and HCV, these do not exist for other infections. Self-testing and POC IVD devices also fall under the scope of the European Directive and are additionally required to perform appropriately, given the skills and means available to the intended users, and

the variation that can reasonably be anticipated in their technique and environment. The regulation of health-related mobile phone apps and websites is currently being debated in both Europe and the US. There is country specific legislation regulating the availability of POC diagnostic devices directly to the public. Quality control of the production of commercially available diagnostic tests is regulated by CE-marking. Quality assurance and quality control of testing facilities however are not regulated at the European level. European countries may have their own accreditation scheme. New testing technologies combined with modern information and communication systems will enable the development of novel testing pathways. These novel approaches have the potential to improve access to, and hence uptake of, testing among individuals and population groups at risk as well as increase the proportion of infected individuals treated earlier in infection. These novel approaches will have clinical impact by improving the prognosis for those with infections as well as public health impact by reducing onward transmission and thus incidence and prevalence of infection. Research priorities for novel technologies for HIV, HBV, HCV and STI testing include: developing models, or frameworks, for strategic, evidence based decision making on adoption of novel approaches to testing; technology adoption type reviews of novel technologies and approaches; operational research on the implementation of testing programmes; and continued development and improvement of the technical aspects of testing devices.

Atlas of Male Genital Disorders Marco Cusini 2013-07-16 Male genital disorders represent a common issue in medical practice, especially in the dermatological setting. Correct clinical evaluation of these disorders is essential when addressing the diagnosis, which in some cases may require histopathological confirmation. Depending on the disease, early diagnosis may be not only lifesaving, but also of fundamental importance to the

planning of successful treatment. This atlas introduces the most common penile diseases, along with more rarely encountered ones. It provides invaluable guidance on clinical diagnosis by highlighting prominent clinical features and presenting particular videodermoscopy findings when these are indicative of the diagnosis. In addition, for each condition the most appropriate treatment is proposed, taking into account recent therapeutic advances of proven benefit.

Sexually Transmitted Diseases Sourcebook Laura Larsen 2009 Sexually transmitted diseases are passed through microorganisms that survive on the genital area or through bodily fluids. Many of them do not have clear symptoms, and long-term undiagnosed infections can lead to other health problems such as infertility, cancers, and the continuing spread of disease. Some STDs, such as chlamydia and gonorrhea, are curable with proper treatment, but others are not. Some diseases, such as syphilis, once decreasing in number are on the rise in certain populations.

Consolidated guidelines on HIV, viral hepatitis and STI prevention, diagnosis, treatment and care for key populations

World Health Organization 2022-07-29 The Consolidated guidelines on HIV, viral hepatitis and STI prevention, diagnosis, treatment and care for key populations outline a public health response for five key populations (men who have sex with men, trans and gender diverse people, sex workers, people who inject drugs and people in prisons and other closed settings). They present and discuss new recommendations and consolidate a range of recommendations and guidance from current WHO guidelines. Particularly for key populations, social, legal, structural and other contextual factors both increase vulnerability to HIV, viral hepatitis and STIs and obstruct access to health and other essential services. These guidelines highlight the critical importance of addressing structural barriers in all settings as a priority. In most countries, inadequate coverage and poor quality of services for key populations continue to undermine responses to HIV, viral hepatitis and STIs. All countries should prioritise reaching key populations and supporting key population communities to lead the response and provide equitable, accessible and acceptable services. In most countries, inadequate coverage and poor quality of services for key populations continue to undermine responses to HIV, viral hepatitis and STIs. All countries should prioritise reaching these key populations and supporting key population communities to lead the response and provide equitable, accessible and acceptable services to these groups.
