The Fifth Vital Sign: Master Your Cycles & Optimize Your Fertility - Lisa Hendrickson-Jack 2019-01-21

MENSTRUATION ISN'T JUST ABOUT HAVING BABIES Your menstrual cycle is a vital sign, just like your pulse, temperature, respiration rate, and blood pressure. And it provides you with essential information about your health. The Fifth Vital Sign: Master Your Cycles and Optimize Your Fertility brings together over 1,000 meticulously researched scientific references in a textbook-quality guide to understanding your menstrual cycle. In this book you'll learn: -What a normal cycle looks like; -The best way to chart your cycle and increase your fertility awareness; -How best to manage critical aspects of your health, including better sleep, exercise and a healthier diet; -Natural methods for managing period pain and PMS; -How to successfully avoid pregnancy without the pill; and -How to plan ahead if you do want to get pregnant. The Fifth Vital Sign aims to better connect women with their menstrual cycles, to break the myth that ovulation is only important when you're ready to have a baby. READ THE FIFTH VITAL SIGN TO BETTER UNDERSTAND YOUR HEALTH AND FERTILITY Whether children are a part of your future plans or not, your health matters. Start learning more now, and take control of your health. ABOUT THE AUTHOR Lisa Hendrickson-Jack is a certified Fertility Awareness Educator and Holistic Reproductive Health Practitioner. She teaches women to chart their menstrual cycles for natural birth control, conception, and overall health monitoring. In her work, Lisa draws heavily from the current scientific literature and presents an evidence-based approach to fertility awareness and menstrual cycle optimization.

Androgens in Health and Disease - Carrie Bagatell 2003-05-27

Authoritative researchers and clinicians review our latest understanding of andrology in both basic science and clinical medicine. Topics range from explaining the biology of androgens-from several different perspectives-to illuminating their role in the development and modulation of physiologic systems. Authors demonstrate in a number of cases that testosterone can be a useful adjunct to the treatment of a variety of disease states. Other chapters consider important topics such as androgens use in athletes, the potential of androgens to improve physical function and quality of life in older men, and androgens as potential male contraceptives.

Reproductive Processes and Contraception - Kenneth W. McKerns 2013-03-13

This monograph represents the eighth sponsored by the International Society for Biochemical Endocrinology. The topics should be of interest to basic research scientists, medical practitioners, and students of reproductive biology. It complements our monograph published in 1979 on Structure and Function of the Gonadotropins. The monograph is organized in ten topic areas relative to the general theme of reproduction and contraception. There are several chapters in each area. Obviously, all aspects of each area could not be covered. An attempt was made to seek interesting basic research ideas and concepts that might in the future be applicable to fertility regulation. The topics are: interactions in gonadotropin regulation; GnRH analogues as contraceptive agents; receptors in cellular localization of hormones; uterine and mammary receptors; germ-cell regulation and secretory proteins; control mechanisms and metabolic regulations; hCG peptides and anti sera as antifertility agents; ieutinization, oocyte maturation, and early pregnancy; steroids and cell growth; and finally, prostaglandins and cell function. The studies encompass many disciplines and techniques in anatomy, physiology, biochemistry, and endocrinology in animals and humans, both in vitro and in vivo. A conference of contributors was held in Maine at the Asticou Inn in Northeast Harbor during the week of September 9-13, 1979. The chapters as written for the monograph were presented for discussion by the participants, who were selected for their knowledge of, and contributions to, this area of scientific investigation.

Fertility Control - S.L. Corson 1995-12-15

This is the second edition of Corson, Derman, and Tyrer's complete medical textbook on fertility control. It has been revised and fully updated to include details about oral contraceptives and new progestins, the female condom, hormonal implantation, new information about IUDs, and the biochemistry, biological effects, and uses of mifepristone (RU-486).

Contraceptive Steroids - A. T. Gregoire 2013-03-13

One of the United States Food and Drug Administration's most difficult tasks is the assessment of risk-benefit ratios for a broad spectrum of therapeutic and prophylactic drugs. Furthermore, it is now widely recognized that no drug, chemical or even natural substance is completely devoid of risk. Nowhere has this issue been the subject of more controversy than with steroidal contraceptive drugs. Regulated as a special class of products because of their prophylactic use in healthy individuals for prevention of pregnancy rather than for treatment of disease, steroid contraceptives drugs undergo more extensive animal safety tests than any other pharmaceutical agent. This view also contemplates the availability of alternative contraceptive measures posing fewer risks, but the use of less effective methods must take into consideration the hazards associated with pregnancy itself. In April 1983, the Food and Drug Administration and the National Institutes of Health in cooperation with the World Health Organization, the Population Council, and the Agency for International Development sponsored a three-day workshop to evaluate current guidelines for preclinical safety studies of contraceptive drugs in light of our extensive knowledge of the side effects of marketed products. The meeting included presentations by experts in the fields of comparative metabolism, pharmacokinetics, pharmacology, carcinogenicity, toxicology, coagulation, lipid metabolism, epidemiology and pathology at a meeting of the Fertility and Maternal Health Drugs Advisory Committee of the National Center for Drugs and Biologics, Food and Drug Administration.

Sexual Dysfunction - Richard Balon 2008-01-01

The area of human sexuality, and sexual dysfunction in particular, has been undergoing enormous developments and advances. This volume, written by a team of international experts in the area of sexology, is an authoritative review of the latest developments in this field. Areas such as evaluation of sexual dysfunction, impact of psychotropic medications, mental and physical illness and substance abuse on sexual functioning are covered in a highly informative manner. In addition, several sexual dysfunctions, namely hypoactive sexual desire disorder, male erectile disorder and premature ejaculation are reviewed. A chapter on the developments in imaging of sexual dysfunction, an area that is undergoing rapid expansion, is also included. This publication, filled with a variety of clinically essential information, provides psychiatrists, psychologists, sex therapists, urologists, gynecologists, both clinically and research oriented, with the latest developments in the area of sexual dysfunction.

Combined Estrogen-progestogen Contraceptives and Combined Estrogen-progestogen Menopausal Therapy - IARC Working Group on the Evaluation of Carcinogenic Risks to Humans 2007

Oral contraceptives for family planning worldwide have revolutionized the reproductive lives of millions of women since their introduction in the 1960s. Later on, a variety of side-effects including cardiovascular diseases was recognized. In response to these concerns, new generations of combined oral contraceptives were developed that featured lower dose of estrogen and newer, more potent progestogens. The effectiveness and ease of use of combined hormonal contraceptives suggest that they will continue to be used to a significant extent in the future. This ninety-first volume of IARC Monograph.

The Handbook of Contraception - Donna Shoupe 2007-11-07

I opened my series editor manuscript of The Handbook of Contraception: A Guide for Practical Management, edited by Drs. Donna Shoupe and Siri Kjos, on a tiny plane on the way to giving a lecture in Albany, NY. I expected to peruse the manuscript, and found that I could not put it down. The Handbook of Contraception: A Guide for Practical Management is an incredibly informative and enjoyable read. In

keeping with the objective of this series for primary care clinicians, there is a quality in this title that is uncommon among medical textbooks. The chapters of this book are written with extraordinary intelligence and understanding, and with attention to practical considerations in the selection and management of contraceptive options. The authors have reviewed the science behind contraception, including the chemical structure and effects of hormonal contraception, physiology of contraception, efficacy rates, and side effects, as well as the practical considerations that are relevant in helping patients choose between different contraceptive options. They do this with a clarity of language and intent that lets the book cover with sufficient detail the full range of questions that any primary care clinician will have regarding any of the traditional or new contraceptive options. Also included in each chapter is a section on “counseling tips,” which explicitly answers many of the questions that clinicians and their patients often have when discussing contraceptive options. For a book so useful and well done, the editors and authors deserve our thanks.

Assessing for Ovulation in Transmasculine Individuals on Testosterone - Rebecca L. Taub 2019
 Importance: An estimated 1.4 million people in the United States identify as transgender or non-binary (TNB), signifying that their gender identity does not correspond with their assigned birth sex. Individuals assigned female at birth may seek gender-affirming hormone therapy with injectable testosterone. No studies have directly examined ovulatory function or contraceptive need in transmasculine individuals on testosterone. Objective: Our objective was to determine whether testosterone reliably suppresses ovulation in transmasculine individuals, and to use this and existing data to perform an assessment of unmet need for contraception in this population. Methods: This is an observational prospective trial based at a community clinic serving over 400 patients annually for gender affirming hormone therapy. We enrolled individuals who were assigned female at birth and are currently using or seeking to initiate masculinizing therapy with testosterone (transmasculine individuals). Over a 12-week study period, subjects collected daily urine samples for pregnanediol-3-glucuronide (PdG) testing and completed daily electronic bleeding diaries. We collected monthly serum samples for mid-dosing interval serum testosterone, estradiol and sex-hormone binding globulin (SHBG) levels, and anti-mullerian hormone (AMH) values at baseline and study end. Ovulation was defined as PdG > 5 [micro]g/mL for three consecutive days. We then used these data and the existing literature on fertility and family planning in this population to perform an assessment of unmet need for contraception. Main Outcomes and Measures: Our primary outcome was the proportion of participants who ovulated during the study period. Secondary outcomes included predictors of ovulation such as age, length of time on testosterone, serum testosterone levels, body mass index (BMI), and bleeding pattern. Results: We enrolled 32 individuals and 20 completed the entire study. Median age was 23 (range 18-37). Six participants were new initiators of testosterone and 14 were continuing users. Among continuing users, median duration of testosterone therapy was 9 months (range 2-60 months). One participant-month of ovulation was observed using the standard criteria, however several other participants had transient rises in PdG followed by bleeding episodes suggestive of a dysfunctional ovulatory pattern. Significant research gaps exist in assessing for unmet need for contraception in the transmasculine population. Conclusions and Relevance: This study suggests that testosterone rapidly induces ovulatory dysfunction leading to eventual ovulatory suppression, though intermittent ovulations may be possible even in long-term users. Contraceptive need is largely unrecognized in this community, and more data are needed.

An Assessment of Vaginal Lubrication and Blood Flow in Women Taking Oral Contraceptive Pills - Ariel Baker Handy 2021

Genital sexual arousal, which consists of genital vasocongestion and lubrication, is critical to healthy sexual function in women and closely linked with hormone function. Oral hormonal contraceptive pills, which are used by over a quarter of reproductive-age women in the United States (Daniels, Daugherty, Jones, & Mosher, 2015; Jones, Mosher, & Daniels, 2013), contain either both ethinylestradiol and a synthetic progestin, or solely a synthetic progestin. Oral hormonal contraceptive pills (OCPs) tend to reduce the number of bioavailable androgens through upregulation of sex hormone binding globulin (SHBG; Zimmerman, Eijkemans, Coelingh Bennink, Blankenstein, & Fauser, 2014), and they have been associated with decrements in self-reported arousal and vaginal lubrication (Hassanin, El-Halwagy, Ismail, & Shehab, 2018; Smith, Jozkowski, & Sanders, 2014). The primary aim of this dissertation was to examine differences

in physiological lubrication and vaginal blood flow among women using OCPs with varying androgenic properties, as well as the possible mediating role of SHBG in these relationships. Participants in this study were 130 women: 59 naturally-cycling control women, 50 women taking androgenic OCPs, and 21 women taking antiandrogenic OCPs. Participants watched sexual films while their sexual arousal responses were measured, completed questionnaires, and took part in a blood draw. Results indicated physiological deficits in women taking either form of OCP, with marked inhibitory effects found in women taking antiandrogenic OCPs. Whereas SHBG did not meaningfully mediate the relationships between study group and physiological sexual arousal response, paths within the models indicated significant relationships among these variables. Rates of sexual dysfunction were significantly greater in the antiandrogenic group compared to control. These results further elucidate the effect of sex steroid hormones on women's sexual arousal response and suggest the presence of physiological sexual side effects of various OCPs. It is recommended that prescribing clinicians consult patients on such physiological effects, and future research should examine the maintenance of these effects after OCP discontinuation

Contraceptive Technology - Deborah Kowal 2023-10

The leading family planning reference for over 30 years with more than 2 million copies in print. Contraceptive Technology is a one stop, person-centered reference guide for students and practitioners in sexual and reproductive health care professions. Whether it is family planning, discussing reproductive desires, maintaining contraception while managing a specific condition, abortion, reproductive tract infection or post-partum contraception, this trusted resource can be referenced in any situation when working with patients seeking guidance on reproduction, sexual health, and contraceptive options. Now in its 22nd edition, this best-selling reference provides breadth, depth of knowledge, and expansive research from over 85 medical experts in the fields of contraception, sexual health, reproductive health, and infectious disease. With a holistic approach, this edition continues the tradition of focusing on the individual patients, meeting them where they are to offer respectful, appropriate care and services. Contraceptive Technology elevates awareness of new and time-honored technologies available in contraception, demystifies misperceptions, provides current, fact-based information, and emphasizes a person-centered approach.

Trends in Oral Contraception - R.F. Harrison 2013-11-08

After 20 years of oral contraceptive (OC) use, epidemiological data and scientific research have led to the now accepted evidence that the most important effect produced by these drugs on humans, other than the prevention of unwanted pregnancy, is an increase in the risk of cardiovascular disease. Because the incidence of cardiovascular disease is also related to disturbances of the lipoprotein metabolism, it appears to be opportune to analyse the different aspects of the interaction between female hormones and lipoprotein (LP) metabolism. SERUM LIPOPROTEINS: METABOLISM In the serum, lipids (cholesterol (C), triglycerides (TG), and phospholipids) are associated with peptides called apoproteins: apoproteins A-I, A-11, B, C, etc. The chylomicrons and the very low density lipoproteins (VLDL) are rich in TG and contain the Apo B-48; the low density lipoproteins (LDL) are rich in C and contain the Apo B-100; and the high density lipoproteins (HDL) are rich in proteins (Apo A-I, Apo A-II) and phospholipids.

Hormonal Contraception and Post-menopausal Hormonal Therapy - IARC Working Group on the Evaluation of Carcinogenic Risks to Humans 1999

Evaluates evidence for an increased risk of cancer in women using combined oral contraceptives, progestogen-only hormonal contraceptives, post-menopausal estrogen therapy, and post-menopausal estrogen-progestogen therapy. Although the carcinogenicity of these preparations has been extensively investigated, the book stresses the many complex methodological issues that must be considered when interpreting findings and weighing results. Evidence of an association between use of these preparations and positive effects on health, including a reduced risk of some cancers, is also critically assessed. The first and most extensive monograph evaluates evidence of an association between the use of combined oral contraceptives and cancer at nine sites. Concerning breast cancer, the evaluation concludes that, even if the association is causal, the excess risk for breast cancer associated with patterns of use that are typical today is very small. Studies of predominantly high-dose preparations found an increased risk of hepatocellular carcinoma in the absence of hepatitis viruses. Citing these findings, the evaluation concludes

that there is sufficient evidence in humans for the carcinogenicity of combined oral contraceptives. The evaluation also found sufficient evidence for the carcinogenicity of some, but not all, combined preparations in animals. Combined oral contraceptives were classified as carcinogenic to humans. The evaluation also cites conclusive evidence that these agents have a protective effect against cancers of the ovary and endometrium. Progestogen-only contraceptives are evaluated in the second monograph, which considers the association with cancer at six sites. The evaluation found no evidence of an increased risk for breast cancer. Although the evaluation found sufficient evidence in animals for the carcinogenicity of medroxyprogesterone acetate, evidence for the carcinogenicity of progestogen-only contraceptives in humans was judged inadequate. Progestogen-only contraceptives were classified as possibly carcinogenic to humans. The third monograph, on post-menopausal estrogen therapy, considers evidence of an association with cancer at eight sites. Findings from a large number of epidemiological studies indicate a small increase in the risk of breast cancer in women who have used these preparations for five years or more. Studies consistently show an association between use of post-menopausal estrogen therapy and an

increased risk for endometrial cancer. Data on the association with other cancers were either inconclusive or suggested no effect on risk. The evaluation concludes that post-menopausal estrogen therapy is carcinogenic to humans. The final monograph evaluates the association between the use of post-menopausal estrogen-progestogen therapy and cancer at four sites. The evaluation of limited data on breast cancer found an increased relative risk observed with long-term use. Data were judged insufficient to assess the effects of past use and of different progestogen compounds, doses, and treatment schedules. For endometrial cancer, the evaluation found an increase in risk relative to non-users when the progestogen was added to the cycle for 10 days or fewer. Post-menopausal estrogen-progestogen therapy was classified as possibly carcinogenic to humans. Concerning post-menopausal therapy in general, the book notes that evidence of carcinogenic risks must be placed in perspective of potential benefits. The prevention of osteoporotic fractures is cited as the best-established benefit. Evidence also suggests that estrogen prevents heart disease and may prevent memory loss and dementia.
