Contraceptive Steroids A. T. Gregoire 2013-03-13 One of the United States Food and Drug Administration's most difficult tasks is the assessment of risk-benefit ratios for a broad spectrum of therapeutic and prophylactic drugs. Furthermore, it is now widely recognized that no drug, chemical or even natural substance is completely devoid of risk. Nowhere has this issue been the subject of more controversy than with steroidal contraceptive drugs. Regulated as a special class of products because of their prophylactic use in healthy individuals for prevention of pregnancy rather than for treatment of disease, steroid contraceptive drugs undergo more extensive animal safety tests than any other pharmaceutical agent. This view also contemplates the availability of alternative contraceptive measures posing fewer risks, but the use of less effective methods must take into consideration the hazards associated with pregnancy itself. In April 1983, the Food and Drug Administration and the National Institutes of Health in cooperation with the World Health Organization, the Population Council, and the Agency for International Development sponsored a three-day workshop to evaluate current guidelines for preclinical safety studies of contraceptive drugs in light of our extensive knowledge of the side effects of marketed products. The meeting included presentations by experts in the fields of comparative metabolism, pharmacokinetics, pharmacology, carcinogenicity, toxicology, coagulation, lipid metabolism, epidemiology and pathology at a meeting of the Fertility and Maternal Health Drugs Advisory Committee of the National Center for Drugs and Biologics, Food and Drug Administration.

Androgenetic Alopecia From A to Z Konstantinos Anastassakis 2022-10-26 This second of three related volumes, designed as a reference tool for the understanding and treatment of Androgenetic Alopecia and Female Pattern Hair Loss (AGA/FPHL), is structured in 4 sections: 63 dedicated chapters covering every aspect of medical (non-surgical, non-invasive) and nutritional treatment options and clinical effects. FDA-approved hair growth drugs, every frequently prescribed "off-label" or experimental drug, hormones, cosmeceuticals, and popular fraudulent controversial products are all presented in 26 chapters, with figures, tables, algorithms, and thousands of fully updated and balanced literature citations. Filling a gap in the latest literature, Androgenetic Alopecia From A to Z: Drugs, Herbs, Nutrition, and Supplements includes a thorough review of lifestyle and nutritional factors specifically affecting AGA/FPHL, including excessive caloric intake, high-fat diets, caloric deprivation, alcohol abuse, and smoking. The intricate effects of nutrition on hair loss, one of the

most neglected and misunderstood fields in Dermatology, are presented as well, with a plethora of clinically valuable information: why food supplements are so popular, the regulatory minefield of supplements, and the life-threatening perils of nutritional supplementation, are all reviewed extensively. Each vitamin, major mineral, and trace element implicated in follicular physiology is reviewed in altogether 24 dedicated chapters according to their specific effects on the hair follicle, food sources, dietary recommendations, and the impact of deficiency or excess. This volume includes a comprehensive chapter on the understanding of Complementary-Alternative Medicine (CAM). CAM is an umbrella term for methods that lie outside evidence-based medicine and a part of a societal trend towards the rejection of science as a method of determining facts. The pitfalls and challenges in understanding botanicals with reported hair growth properties, from publication bias to lack of standardization, as well as their unpredictable pharmacological and physiological effects, are all explained in detail. Finally, all popular botanical products reported to possess hair growth properties are appraised in 14 dedicated chapters, each including a detailed review of the general effects, the suggested biochemical mechanisms, claimed actions on the hair follicle, all available studies, and hundreds of literature citations. This carefully crafted book will be an invaluable reference tool for dermatologists and all clinical practitioners dealing with Androgenetic Alopecia and Female Pattern Hair Loss and will help them answer challenging patient questions, debunk myths on hair growth drugs, and supplements and navigate patients towards effective and safe treatment schemes.

Trends in Oral Contraception R.F. Harrison 2013-11-08 After 20 years of oral contraceptive (OC) use, epidemiological data and scientific research have led to the now accepted evidence that the most important effect produced by these drugs on humans, other than the prevention of unwanted pregnancy, is an increase in the risk of cardiovascular disease. Because the incidence of cardiovascular disease is also related to disturbances of the lipoprotein metabolism, it appears to be opportune to analyse the different aspects of the interaction between female hormones and lipoprotein (LP) metabolism. SERUM LIPOPROTEINS: METABOLISM In the serum, lipids (cholesterol (C), triglycerides (TG), and phospholipids) are associated with peptides called apoproteins: apoproteins A-I, A-II, B, C, etc. The chylomicrons and the very low density lipoproteins (VLDL) are rich in TG and contain the Apo B-48; the low density lipoproteins (LDL) are rich in C and

contain the Apo B- 100; and the high density lipoproteins (HDL) are rich in proteins (Apo A-I, Apo A-II) and phospholipids.

Combined Estrogen-progestogen Contraceptives and Combined Estrogen-progestogen Menopausal Therapy IARC Working Group on the Evaluation of Carcinogenic Risks to Humans 2007 Oral contraceptives for family planning worldwide have revolutionized the reproductive lives of millions of women since their introduction in the 1960s. Later on, a variety of side-effects including cardiovascular diseases was recognized. In response to these concerns, new generations of combined oral contraceptives were developed that featured lower dose of estrogen and newer, more potent progestogens. The effectiveness and ease of use of combined hormonal contraceptives suggest that they will continue to be used to a significant extent in the future. This ninety-first volume of IARC Monograph.

Hormonal Contraception and Post-menopausal Hormonal Therapy IARC Working Group on the Evaluation of Carcinogenic Risks to Humans 1999 Evaluates evidence for an increased risk of cancer in women using combined oral contraceptives, progestogen-only hormonal contraceptives, post-menopausal estrogen therapy, and post-menopausal estrogen-progestogen therapy. Although the carcinogenicity of these preparations has been extensively investigated, the book stresses the many complex methodological issues that must be considered when interpreting findings and weighing results. Evidence of an association between use of these preparations and positive effects on health, including a reduced risk of some cancers, is also critically assessed. The first and most extensive monograph evaluates evidence of an association between the use of combined oral contraceptives and cancer at nine sites. Concerning breast cancer, the evaluation concludes that, even if the association is causal, the excess risk for breast cancer associated with patterns of use that are typical today is very small. Studies of predominantly high-dose preparations found an increased risk of hepatocellular carcinoma in the absence of hepatitis viruses. Citing these findings, the evaluation concludes that there is sufficient evidence in humans for the carcinogenicity of combined oral contraceptives. The evaluation also found sufficient evidence for the carcinogenicity of some, but not all, combined preparations in animals. Combined oral contraceptives were classified as carcinogenic to humans. The evaluation also cites conclusive evidence that these agents have a protective effect against cancers of the ovary and endometrium. Progestogen-only contraceptives are evaluated in the second monograph, which considers the association with cancer at six sites. The evaluation found no evidence of an increased risk for breast cancer. Although the evaluation found sufficient evidence in animals for the carcinogenicity of medroxyprogesterone acetate, evidence for the carcinogenicity of progestogen-only contraceptives in humans was judged inadequate. Progestogen-only contraceptives were classified as possibly carcinogenic to humans. The third monograph, on post-menopausal estrogen therapy, considers evidence of an association with cancer at eight sites. Findings from a large number of epidemiological studies indicate a small increase in the risk of breast cancer in women who have used these preparations for five years or more. Studies consistently show an association between use of post-menopausal estrogen therapy and an increased risk for endometrial cancer. Data on the association with other cancers were either inconclusive or suggested no effect on risk. The evaluation concludes that post-menopausal estrogen therapy is carcinogenic to humans. The final monograph evaluates the association between the use of post-menopausal estrogen-progestogen therapy and cancer at four sites. The evaluation of limited data on breast cancer found an increased relative risk observed with long-term use. Data were judged insufficient to assess the effects of past use and of different progestogen compounds, doses, and treatment schedules. For endometrial cancer, the evaluation found an increase in risk relative to non-users when the progestogen was added to the cycle for 10 days or fewer. Post-menopausal estrogen-progestogen

therapy was classified as possibly carcinogenic to humans. Concerning post-menopausal therapy in general, the book notes that evidence of carcinogenic risks must be placed in perspective of potential benefits. The prevention of osteoporotic fractures is cited as the best-established benefit. Evidence also suggests that estrogen prevents heart disease and may prevent memory loss and dementia.

The establishment of networks with adult endocrinologists is, therefore, very important to achieving optimal conditions for a successful transition period. In this book, leading experts discuss major public health issues such as diabetes and obesity. They also review genetic diseases, including Turner syndrome and congenital adrenal hyperplasia.
