This considerably updated and expanded version of a previous best-seller is an account of major aspects of the biology of predators and parasitoids, punctuated with information and advice on which experiments or observations to conduct, and how to carry them out. It emphasizes practicalities and also provides guidance on further literature.

Hétéroptères phytophages et prédateurs d'Afrique de l'Ouest Wiyao Poutouli 2011-05-27 Les études sur la biodiversité ou la mise en oeuvre de la protection intégrée impliquent d'identifier les insectes ravageurs ou les ennemis naturels. Dans certains pays, la culture de plantes transgéniques résistantes aux chenilles, comme le cotonnier ou le maïs, risque d'entraîner une diminution de l'usage des traitements insecticides destinés à lutter contre ces ravageurs. Certaines familles de punaises comme les Pentatomidae et les Miridae sont ainsi devenues des ravageurs principaux. Il convient donc de mieux connaître ces ravageurs parfois considérés comme secondaires. Ce guide est destiné aux personnes oeuvrant sur le terrain, agriculteurs et professionnels de l'encadrement agricole. Ils y trouveront une description brève des principales espèces de punaises phytophages et prédatrices présentes en Afrique de l'Ouest, rencontrées essentiellement sur cotonnier, maïs, niébé (*Vigna unguiculata*), soja et sorgho.

The Ethology of Predation E. Curio 2012-12-06 Predation is an ecological factor of almost universal importance for the biologist who aims at an understanding of the habits and structures of animals. Despite its pervasive nature opinions differ as to what predation really is. So far it has been defined only in negative terms; it is thought not to be parasitism, the other great process by which one organism harms another, nor filter-feeding, carrion-eating, or browsing. Accordingly, one could define predation as a process by which an animal spends some effort to locate a live prey and, in addition, spends another effort to mutilate or kill it. According to this usage of the word a nudibranch, for example, that feeds on hydroids would be a predator inasmuch as it needs some time to locate colonies of its prey which, after being located, scarcely demand more than eating, which differs little from browsing. From the definition just proposed consumption of the prey following its capture has been intentionally omitted. Indeed, an animal may be disposed of without being eaten. Hence the biological significance of predation may be more than to maintain nutritional homeostasis. In fact, predation may have something in common with the more direct forms of competition, a facet that will be only cursorily touched upon in this book.

Animal Vigilance Guy Beauchamp 2015-06-29 *Animal Vigilance* builds on the author's previous publication with Academic Press (*Social Predation: How Group Living Benefits Predators and Prey*) by developing several other themes including the development and mechanisms underlying vigilance, as well as developing more fully the evolution and function of vigilance. Animal vigilance has been at the forefront of research on animal behavior for many years, but no comprehensive review of this topic has existed. Students of animal behavior have focused on many aspects of animal vigilance, from models of its adaptive value to empirical research in the laboratory and in the field. The vast literature on vigilance is widely dispersed with often little contact between models and empirical work and between researchers focusing on different taxa such as birds and mammals. *Animal Vigilance* fills this gap in the available material. Tackles vigilance from all angles, theoretical and empirical, while including the broadest range of species to underscore unifying themes. Discusses several newer developments in the area, such as vigilance copying and effect of food density. Highlights recent challenges to assumptions of traditional models of vigilance, such as the assumption that vigilance is independent among group members, which is reviewed during discussion of synchronization and coordination of vigilance in a group. Written by a top expert in animal vigilance.

Les grands prédateurs d'Afrique Pierre-Jean Corson 2005 Biologiste et naturaliste par formation, docteur en médecine, médecin en brousse, grand chasseur, Pierre-Jean Corson a passé le plus clair de son existence sur le terrain même de ses passions : l'observation, l'approche et la connaissance approfondie de la faune africaine en générale et des grands fauves en particulier. Humaniste et admirateur du monde animal dans son infinie variété, il a placé et décrit ces grands prédateurs dans leur environnement historique et légendaire et dans leurs rapports avec l'homme africain, son quotidien et son imaginaire. Homme de science, il s'est attaché à donner des descriptions anatomiques et biologiques précises de ces animaux ainsi que de leurs modes et conditions de vie. Etendant son propos à la notion de prédation, il a aussi dressé un panorama des autres prédateurs africains, les plus petits comme les non mammifères. Chasseur, il a voulu pour eux faire un livre pratique en portant une grande attention à l'étude comportementale des fauves : lions, panthères, guépards, hyénidés.

Relaxation Oscillations in Mathematical Models of Ecology A. I. Kolesov 1995 This book presents for the first time a systematic exposition of

techniques for constructing relaxation oscillations and methods for investigating stability properties of certain classes of systems with delay. The authors bring out some of the distinctive features that have no analogues in relaxation systems of ordinary differential equations. The exposition provides analysis of significant examples from biophysics, mathematical ecology, and quantum physics that elucidate important patterns. Many unsolved problems are posed. The book would appeal to researchers and specialists interested in the theory and applications of relaxation oscillations.

Predation in Vertebrate Communities Bogumila Jedrzejska 1998-07-20 Predation, one of the most dramatic interactions in animals' lives, has long fascinated ecologists. This volume presents carnivores, raptors and their prey in the complicated net of interrelationships, and shows them against the background of their biotic and abiotic settings. It is based on long-term research conducted in the best preserved woodland of Europe's temperate zone. The role of predation, whether limiting or regulating prey (ungulate, rodent, shrew, bird, and amphibian) populations, is quantified and compared to parts played by other factors: climate, food resources for prey, and availability of other potential resources for predators.

Raptor Prey Remains Ed Drewitt 2020-09-07 Are you curious about the remains of an animal you have found? This compilation of the most likely found body parts of animals eaten by raptors will help you identify your discovery. Including over 100 species of bird and mammal prey of raptors such as sparrowhawks, peregrines and hen harriers, this photographic guide highlights the common feathers, fur and other body parts found at raptor nests, roosts, plucking posts and other opportunistic spots. Discovering what raptors eat is an important part of confirming their feeding ecology and how this might change over time, vary on a local level or in response to changing prey populations, as well as dispelling myths and assumptions about what certain raptor species eat. Diet studies are vital for the conservation of raptor species; the more we know about what they need for survival the more we can predict and plan long-term for the protection and survival of raptors that may be vulnerable and in decline. This is the first book to show in detail the actual parts of a bird, mammal or other animal that you are likely to find in a garden, woodland or beneath a raptor roost. As more people take an interest in raptors and watch species such as peregrines via webcams and through watch groups, there is greater opportunity for finding prey remains. This book provides the first and most important step in identifying a prey species.

Analysis of vertebrate predator-prey community Vadim Sidorovich 2011-09-01 This monograph is about predation in vertebrate animal community. The studies were done in the seminatural terrains with transitional mixed forest within the European forest zone in Belarus. The result part was organised as a top-down flow: First, the community characteristics related to predators were estimated. I presented data on predator species richness, population density and biomass with special attention paid to the changes in predator species diversity occurred during the last two centuries and particularly in connection with the American mink and raccoon dog naturalization. Then, the main features of predator food niches were given, and the structure of various predator guilds and size structure in predators were analysed. The next part of the monograph was devoted to examining of community-important factors acting in semi-natural terrains. Such factors affected either the whole community or its marked fragment. The last quite a large part of the monograph consisted of many chapters which present more or less essential results on different predator species, and stresses hot questions of their population ecology.

The Eye of the Crocodile Val Plumwood 2012-11-01 Val Plumwood was an eminent environmental philosopher and activist who was prominent in the development of radical ecophilosophy from the early 1970s until her death in 2008. Her book *Feminism and the Mastery of Nature* (1992) has become a classic. In 1985 she was attacked by a crocodile while kayaking alone in the Kakadu national park in the Northern Territory. She was death rolled three times before being released from the crocodile's jaws. She crawled for hours through swamp with appalling injuries before being rescued. The experience made her well placed to write about cultural responses to death and predation. The first section of *The Eye of the Crocodile* consists of chapters intended for a book on crocodiles that remained unfinished at the time of Val's death. The remaining chapters are previously published papers brought together to form an overview of Val's ideas on death, predation and nature.

Predator-Prey Interactions: Co-evolution between Bats and Their Prey David Steve Jacobs 2017-02-08 This book provides a comprehensive review of the evolution of traits associated with predation and predator defense for bats and all of their prey, both invertebrates (e.g. insects) and vertebrates (e.g. frogs), in the context of co-evolution. It reviews current knowledge of how echolocation and passive hearing are used by bats to hunt prey in complete darkness. Also it highlights how prey have evolved counter measures to bat echolocation to avoid detection and capture. This includes the whole range of prey responses from being active at times when bats are inactive to the use of acoustic signals of their own to interfere with the echolocation system of bats.

Cheats and Deceits Martin Stevens 2016-02-04 In nature, trickery and deception are widespread. Animals and plants mimic other objects or species in the environment for protection, trick other species into rearing their young, lure prey to their death, and deceive potential mates for reproduction. Cuckoos lay eggs carefully matched to their host's own clutch. Harmless butterflies mimic the wing patterning of a poisonous butterfly to avoid being eaten. The deep-sea angler fish hangs a glowing, fleshy lure in front of its mouth to draw the attention of potential prey, while some male fish alter their appearance to look like females in order to sneak past rivals in mating. Some orchids develop the smell of female insects in order to attract pollinators, while carnivorous plants lure insects to their death with colourful displays. In this book, Martin Stevens describes the remarkable range of such adaptations in nature, and considers how they have evolved, and become increasingly perfected as part of an arms race between predator and prey or host and parasite. He explores the work of naturalists and biologists from Alfred Russel Wallace to current research, showing how scientists find ways of testing the impact of particular behaviours and colourings on the animals it is meant to fool, as opposed to our human perceptions. Drawing on a wide range of examples, Stevens considers what deception tells us about the process of evolution and adaptation.

Top Predators in Marine Ecosystems C. J. Camphuysen 2006-05-11 The sustainable exploitation of the marine environment depends upon our capacity to develop systems of management with predictable outcomes. Unfortunately, marine ecosystems are highly dynamic and this property could conflict with the objective of sustainable exploitation. This book investigates the theory that the population and behavioural dynamics of predators at the upper end of marine food chains can be used to assist with management. Since these species integrate the dynamics of marine ecosystems across a wide range of spatial and temporal scales, they offer new sources of information that can be formally used in setting management objectives. This book examines the current advances in the understanding of the ecology of marine predators and will investigate how information from these species could be used in management.
