**Dermatological Atlas of Indigenous People** Marcos Cesar Florian 2017-09-07 Skin diseases are highly prevalent among indigenous people, leading to low mortality but greatly impacting their quality of life. Such diseases can be observed in indigenous people; both those living in isolated communities and those who have since been urbanized to some degree share a common characteristic of presenting different clinical patterns than non-indigenous individuals. These specificities necessitate a special approach when diagnosing dermatologic diseases in indigenous people. However, these considerations are rarely discussed in standard dermatology books. This Atlas addresses that gap by providing specific materials for professionals involved in the health of indigenous people, especially with those who live either alone or in remote areas. It offers a comprehensive overview of the most common skin diseases in specific tribes, providing a full clinical guide on the dermatologic signs and symptoms in these individuals. Additionally, the book complements the clinical standpoint with an anthropologic perspective, examining the impact of dermatologic diseases in indigenous people and the different meaning of these diseases in their lives. Most of the material presented in this Atlas was collected in the Xingu Program, a project created in 1965 by the Federal University of São Paulo, Brazil, and devoted to providing medical care to indigenous people from the Upper Xingu region, in the heart of the Amazon rainforest. Thus, the content is primarily applicable to South American indigenous people. However, the common characteristics of the isolation and non-urbanization of these communities, as well as the anthropologic perspective adopted here, allow the content to be extrapolated to other indigenous peoples worldwide. This Atlas will be a novel and valuable resource for health professionals who work with indigenous peoples, especially in geographic areas where dermatologists are not always readily available.

**Sexually Transmitted Infections** National Academies of Sciences, Engineering, and Medicine 2021-12-24 One in five people in the United States had a sexually transmitted infection (STI) on any given day in 2018, totaling nearly 68 million estimated infections. STIs are often asymptomatic (especially in women) and are therefore often undiagnosed and unreported. Untreated STIs can have severe health consequences, including chronic pelvic pain, infertility, miscarriage or newborn death, and increased risk of HIV infection, genital and oral cancers, neurological and rheumatological effects. In light of this, the Centers for Disease Control and Prevention, through the National Association of County and City Health Officials, commissioned the National Academies of Sciences, Engineering, and Medicine to convene a committee to examine the prevention and control of sexually transmitted infections in the United States and provide recommendations for action. In 1997, the Institute of Medicine released a report, *The Hidden Epidemic: Confronting Sexually Transmitted Diseases*. Although significant scientific advances have been made since that time, many of the problems and barriers described in that report persist today; STIs remain an underfunded and comparatively neglected field of public health practice and research. The committee reviewed the current state of STIs in the United States, and the resulting report, *Sexually Transmitted Infections: Advancing a Sexual Health Paradigm*, provides advice on future public health programs, policy, and research.
