**Healing Fibroids** - Allan Warshowsky  
2010-05-11

An exciting new approach to regaining health without surgery! Fact: By the time they reach menopause forty percent of American women have at least one uterine fibroid; 600,000 women are diagnosed each year. Fact: Fibroids are the leading cause of hysterectomy, the second most common surgical procedure performed on women. Fact: Natural, holistic medicine can heal fibroids without invasive surgery. Fibroid

tumors, while usually benign, can swell a woman's uterus to the size of a basketball, frequently causing heavy menstrual bleeding, cramping, bladder infections, and even infertility. Most doctors recommend surgery as the only answer. Now this innovative holistic program brings new hope for a surgery-free life to millions of American women. Dr. Allan Warshowsky combines traditional Western medicine and holistic science to cure not just the fibroid condition but also the underlying imbalances and systemic dysfunctions that can cause fibroids. With an exciting program of diet, exercise, supplements, herbs, and mind/spirit work, Dr. Warshowsky shows fibroid sufferers how to become the strong, healthy women they deserve to be.

**Uterine Fibroids** - Lisa Kaminski Msn Rn  
2019-08-06

Uterine fibroids affect up to 80% of women in the United States. While some are asymptomatic, many women experience debilitating pain and heavy bleeding. Fibroids are the number one reason for having a hysterectomy. However, many things affect the growth and development of these fibroids. Poor diet, sedentary lifestyle, lack of sleep, stress, and mental state all play a large role. I will take you through my personal journey, and with my experience as a registered nurse, share my knowledge of the best diet, nutritional supplements, and many holistic therapies. These include acupuncture, kinesiology, Emotional Freedom Technique, Bio-identical hormone therapy, Homeopathy, and Naturopathy. I also discuss the pros and cons of conventional therapies such as endometrial ablation, uterine fibroid embolization, MRI-guided ultrasound, and hysterectomy. I will share the importance of using healthy beauty products and how to find them, safe water sources as well as book suggestions to help you make the best decisions for your health. Lastly, I share with you the most important component of getting well.

Uterine Fibroid, a Simple Guide to the Condition, Diagnosis, Treatment and Related Conditions - Kenneth Kee 2016

Uterine Fibroids are medical benign tumors (non-cancerous) of the smooth muscles of the uterine cavity. They are the most frequent tumor found in women (25%) especially after the age of 35. Uterine fibroids are tumors that grow in a woman's womb (uterus). These growths are normally not cancerous (benign). Fibroids are normally relatively avascular and may degenerate forming cysts and becoming calcified. They are believed to be caused by: 1. Hormones in the body 2. Genes (may run in families) 50% of all women have fibroids by age 50. Frequent symptoms are: 1. Heavy menstrual flow sometimes with blood clots 2. Irregular menstrual periods 3. Painful menses 4. Backache 5. Pain with exercise 6. Painful and frequent urination Pelvic examination may show enlarged uterine swellings Ultrasound scans showed presence of fibroids Hysteroscopy uses a long, thin tube placed through the vagina and into the womb to examine the inside of the uterus 1. If small no treatment is required. 2. If larger, then treatment depends on the size, extent of the lesions, age of the patient and the desire for pregnancy. 3. Birth control pills to help control heavy periods 4. Intrauterine devices (IUDs) that secrete hormones to decrease the heavy bleeding and pain 5. Correction of anemia Surgery is needed if larger: Myomectomy. (removal of the fibroid and part of the lining of the uterine wall) This surgery excises the benign fibroid tumors from the uterus. The procedure is a good choice if the patient wants to have children. It will not prevent fibroids from growing again. Hysterectomy (removal of the whole uterus or womb) This surgery removes the uterus completely. It may be an option if the patient does not want children, medicines do not work, or the patient cannot have any other procedures. TABLE OF

CONTENT Introduction Chapter 1 Uterine Fibroid Chapter 2 Causes Chapter 3 Symptoms Chapter 4 Diagnosis Chapter 5 Treatment Chapter 6 Prognosis Chapter 7 Uterine Polyp Chapter 8 Uterine Cancer Epilogue All women have fibroids some small some bigger. In fact fibroid is very common especially before menopause. The fibroid is believed to be thickened muscle tissue in the uterus or womb. Most of the patients with fibroid do not show any symptoms but those with complications may have severe bleeding or pain. Always send the patient with heavy menstrual bleeding for a comprehensive gynecological examination.

*Fibroids* - James H. Segars 2012-11-19

Fibroids are benign growths of the uterus. They are the most common tumours found in women (20-30% of women), usually in later reproductive years. This book covers evidence-based indications for treatment of uterine fibroids in

gynecology, the management of fibroids in pregnancy, surgical treatments and outcomes, rare fibroid syndromes, and more.

**Fibroids** - Bryan Lewis 2004-09-24

This book is about a clear, concise explanation of fibroids and their treatments. Fibroids are common benign tumors of the uterus that have been most frequently treated by hysterectomies. A hysterectomy is the removal of the uterus, however, by removing the uterus, reproductive potential is eliminated. Most women do not wish to lose their reproductive organs whether or not they are interested in childbearing functioning. The authors, Myron E. Moorehead, M.D. and Bryan A. Lewis, Ph.D. wrote the book to inform women who have been diagnosed with symptomatic fibroids that there are viable alternatives to hysterectomies for the successful treatment of fibroids. Physicians must respond to the strong and growing desire of many women to have a voice in their health care and they must be professionally obligated to communicate to their patients the option of treatment. Today, women want to be informed and active participants rather than passive subjects. No woman should be subjected to a hysterectomy because of fibroids unless she has been fully informed about the alternative and agrees to the decision.

**Fibroids, Menstruation, Childbirth, and Evolution** - Fred Burbank 2009

In the ancestral environment, a human female typically carried at least half a dozen babies to term. The fact that modern women are able to limit the number of children they bear has dramatic consequences for the incidence of uterine fibroids, as well as the clinical care of fibroids patients. *Fibroids, Menstruation, Childbirth, and Evolution* explores these connections, integrating a vast amount of medical knowledge about the uterus into one volume. During pregnancy, the mother's blood prepares for an enormous hemostatic event: the delivery of the placenta. That fetal organ is the vascular link between mother and offspring. At childbirth, one-tenth of mother's cardiac output flows through the placenta, feeding the growing child. When the placenta is sheared away from its attachment to the uterus, two hundred large uteroplacental arteries are ripped apart and bleed profusely into the uterine cavity. For many

hours following delivery, uterine contractions slow blood flow within the uterus, allowing the high concentration of clotting factors built up in the mother's blood during pregnancy to solidify throughout the uterine circulation and stop blood loss. Then, hours later, the tide reverses, most of these uterine blood clots dissolve, and more normal blood flow returns to the uterus. This amazing process occurs with each pregnancy. During this process, the uterus is ischemic and hypoxic. Unlike brain and heart, which can only survive minutes of decreased blood flow, the uterus can withstand dramatically diminished blood flow for hours. In fact, it is natural for this to occur once every few years. Uterine ischemia and hypoxia are a natural part of every woman's genetic makeup. In 1995 a group of French physicians discovered that it was possible to emulate the physiology of childbirth by stopping blood flow to the uterus with small plastic particles. Initially, they injected these particles to diminish blood loss during subsequent fibroid surgery. However, they soon learned that the injection of these particles was therapeutic in and of itself for women with symptomatic fibroids. Unbeknownst to this French group, earlier, in 1964, an American physician surgically occluded the uterine arteries to treat women without fibroids who had excessive monthly menstrual blood loss. Subsequent physicians have occluded the uterine arteries in various ways to treat a third common disorder, adenomyosis. Finally, these clinical successes suggest that future episodes of endometriosis may be preventable in some women treated with uterine artery closure. Dr. Fred Burbank's comprehensive book provides insight into how physicians can use uterine artery closure techniques to more effectively treat uterine disorders. In addition, his book contains short courses on magnetic resonance imaging, hemodynamics, uterine artery embolization, and the hemostatic and hemolytic systems, making it possible for readers less familiar with these complex subjects to understand the text without referring to outside sources. About the Author Dr. Burbank is an epidemiologist, a psychiatrist, a diagnostic radiologist, a cardiovascular interventionalist, and an expert in women's health. He is also an inventor-entrepreneur. For recreation, he flies,

swims, and reads. For more information, please visit his bio on [www.saltcreekmedical.com](http://www.saltcreekmedical.com).
