*Development of a Motor Unit Number Estimation Technique in Normal Dogs* Laura Vasquez, 2011 Motor unit number estimation (MUNE) is an electrophysiologic technique for quantifying the lower motor neuron (LMN) system. MUNE has proven useful in evaluating and monitoring neurodegenerative diseases such as amyotrophic lateral sclerosis (ALS). Recently a missense mutation in the canine superoxide dismutase 1 (SOD1) gene has been shown to be a risk factor for canine degenerative myelopathy (DM) suggesting homology to familial SOD1 ALS. To date, the LMN component of DM has not been well characterized or quantified. The modified incremental stimulation MUNE technique was applied to the sciatic-deep peroneal nerve branch with bilateral recordings at the extensor digitorum brevis muscle of 17 clinically normal dogs. Mean ( $\pm$  SD) value for the entire MUNE pool was  $51 \pm 21$  with a range from 8 to 154. No statistically significant difference was noted between pelvic limbs ( $P=0.14$ ) or between different age groups (7 years old or  $\geq 7$  years old) ( $P=0.17$ ). Test-retest reliability was assessed for trials performed under different anesthetic episodes (intermittent) versus trials performed under the same anesthetic episode (consecutive). The intraclass correlation coefficients for consecutive and intermittent MUNE evaluations were 0.73 and 0.65, respectively. These results provide preliminary reference ranges for normal dogs and document the potential utility of EDB modified incremental stimulation MUNE for longitudinal monitoring of lower motor neuron loss in DM affected dogs.

**Medical, Genetic & Behavioral Risk Factors of German Shepherd Dogs** Ross D. Clark, 2014-05-30 This book provides you with a thorough description and positive attributes of this breed including origin, purpose, history, normal heights and weights, acceptable colors and behavioral traits. Our books differ from most books on dog breeds because this book also provides you with a comprehensive and authoritative source of all the known predisposed hereditary health syndromes for the breed. You will find extensive references for each problem described. We also provide the breed club address for this breed and a list of laboratories and organizations that can provide professional help and information. As a small animal veterinarian, I have always been intrigued by the way dogs have been bred to fill a purpose in life and further

impressed that they also tend to love performing that service. Greyhounds and other sight hounds are built for speed with aerodynamic bodies consisting of small head, deep chest, narrow waist and large leg muscles. On the other hand Dachshunds take their name from German words meaning badger dog and they use their long nose, long body and short legs to both track, enter and dig into badger dens. After developing a practice that catered to clients with show dogs, my interest in each breed continued to grow as I studied and observed more and more about the unique predisposition and incidence of health problems in each breed. Breeders of purebred dogs for show were a challenge and inspirational for me to research and help them with their unique health problems. Historically references to hereditary problems are scattered throughout various Veterinary medical texts and journals such as ophthalmology, neurology, gastroenterology, cardiovascular and dermatology. This book, as well as the other books and articles I have written, is researched and compiled with the intention to provide both veterinarians and dog owners with comprehensive and authoritative predisposition information under the breed name. At the date of this publication, The American Kennel Club Canine Health Foundation and the The Kennel Club of England reports over 400 known hereditary health syndromes throughout the dog kingdom. At the writing of my first book in 1983, less than 50 hereditary issues are able to be predicted and or diagnosed. Sequencing of the canine genome, DNA tests, metabolic testing including blood tests and urine testing; plus, phenotypic examinations such as radiographs, ultrasound, and CERF or OFA eye registry exams by a Board Certified Veterinary Ophthalmologist have advanced the science of breed related health and behavioral problems. This book will provide veterinarians, researchers, pet owners and breeders with a comprehensive guide to all the known problems veterinarians and dog owners should consider during pet selection and throughout each life stage of our canine friends.

**Motor Unit Characterization in Canine Degenerative Myelopathy** Brandie Morgan, 2013 Dogs homozygous for missense mutations in superoxide dismutase 1 (SOD1) develop a late-onset neuromuscular disorder called degenerative myelopathy (DM) that has many similarities to amyotrophic lateral sclerosis (ALS). Both disorders are characterized by widespread progressive declines in motor and sensory functions accompanied by atrophic changes in the ascending and descending spinal cord tracts. Additionally, some forms of ALS are also associated with SOD1 mutations. In end-stage ALS, death usually occurs as a result of respiratory failure due to severe functional impairment of respiratory muscles. The mechanisms that lead to this loss of function are not known. Dogs with DM are euthanized at all stages of disease progression providing an opportunity to characterize the onset and progression of any pathological changes in the respiratory muscles that may precede respiratory failure. To characterize such potential disease-related pathology we evaluated intercostal muscles from Boxer and Pembroke Welsh Corgi (PWC) dogs that were euthanized at various stages of DM disease progression. DM was found to result in intercostal muscle atrophy, fibrosis, and an alteration in muscle fiber type composition. This pathology was not accompanied by retraction of the motor axon terminals from the muscle acetylcholine

receptor complexes, suggesting that the muscle atrophy did not result from physical denervation. To determine if other components of the thoracic motor unit (cell body, axon, and myofibers) also demonstrated morphological changes consistent with dysfunction, histopathologic and morphometric analyses were conducted on thoracic spinal motor neurons (MNs) and in motor root axons from DM-dogs. Because sensory dysfunction is known to occur in DM, dorsal root ganglia (DRG), and sensory root axons were also analyzed. No alterations in MNs, or motor root axons were observed in either breed. However, advanced stage PWCs exhibited significant losses of sensory root axons, and numerous DRG sensory neurons displayed evidence of degeneration. These results indicate that intercostal muscle atrophy in DM is not preceded by physical loss of the MNs innervating these muscles, or of their axons. Axonal loss in thoracic sensory roots and sensory nerve death suggest sensory involvement may play an important role in DM disease progression. Results from this investigation support previous findings that DM is a multisystem disease with many similarities to human familial SOD1-D90A ALS, indicating that DM is a suitable disease model for this form of ALS. Further analysis of the mechanisms responsible for these morphological findings would aid in the development of therapeutic intervention for both diseases.

**Quantitative Assessment of HSP70, IL-1 $\beta$  and TNF-a in Spinal Fluid and Spinal Cord Sections of Dogs with Histopathologically Confirmed Degenerative Myelopathy and Control Dogs** Mathew Collin Lovett, 2013 Abstract: Pro-inflammatory cytokines such as IL-1 $\beta$  and TNF-a appear to play important roles in autoinflammation associated with amyotrophic lateral sclerosis (ALS), but underlying cellular mechanisms related to this process remain to be fully defined. Canine Degenerative myelopathy (DM) is a spontaneous large animal model of familial ALS of man and represents a valuable tool through which to evaluate the role of these pro-inflammatory cytokines in the neurodegenerative process. Here we quantify the expression of IL-1 $\beta$  and TNF-a in conjunction with hsp70 (another potent stimulator of the innate immune response) in cerebrospinal fluid (CSF) and spinal cord sections from control dogs and dogs with histopathologically confirmed DM. Concentrations of hsp70, IL-1 $\beta$  and TNF-a in CSF were determined using high sensitivity ELISA, and protein expression in various regions of the spinal cord was determined by immunohistochemical staining (IHC) and quantified using Aperio Scanscope (Aperio Technologies, Vista, CA). Concentrations of all three proteins were below the limit of assay detection in CSF for both normal (n=10) and DM affected dogs (n=10). Tissue analysis of IHC staining revealed enhanced hsp70 expression in ependymal cells of dogs with DM compared to controls (p=0.003). IL-1 $\beta$  and TNF-a staining was reduced in white matter of DM affected dogs, likely artifactual due to negative staining created by the pathology associated with DM. Based on these findings, hsp70 could serve as an important biomarker or trigger for sustained inflammation in DM and ALS and further research in this area is warranted.

**Molecular Genetic Studies in Canine Inherited Diseases Including Neonatal Cerebellar Ataxia, Degenerative Myelopathy and Multiple System Degeneration** Rong Zeng, 2013 The inherited diseases of the domestic dog mimic a

wide spectrum of common human disorders. By identifying the genes that harbor the mutations underlying dog diseases we not only provide powerful diagnostic DNA tests for dog breeders their veterinarians and but also provide spontaneously occurring canine models for human diseases. Since the first high quality dog genome reference sequence was published and made publically accessible, various molecular strategies have been applied in the canine genetic studies including candidate gene analysis, linkage analysis, and genome-wide allele association studies. Most recently our lab has focused on the discovery of causal sequence variants in the next generation whole-genome sequences of individual affected dogs. This has enabled us to identify disease-causing genes in dogs with relevance for human health. We describe here the identification of causative mutations for three different canine diseases: neonatal cerebellar ataxia, canine degenerative myelopathy and canine multiple system degeneration. In addition, we discuss the potential importance of these canine diseases if used as human disease models.
