The Genetics of Sex Hormones and Their Effects on

Mammographic Density in Women - Cameron B. Haas 2021

In this work we leveraged genomic information from large-scale population-based studies to explore the relationships between three epidemiologic factors associated with breast cancer in women: 1) mammographic density, 2) sex hormone concentrations, and 3) body mass index (BMI). Mammographic density, which describes the proportion of dense (i.e., epithelial and stromal) tissue in the breast, is one of the strongest predictors of breast cancer in women. Women with extremely dense breasts have a 3 to 6-fold increased risk of breast cancer compared to those with primarily fatty breasts. Breast cancer is generally considered to be a primarily hormone-driven cancer, an attribute that has led to the development of effective treatment and prophylactic strategies for hormone receptor positive subtypes and cause for investigating the role of endogenous hormones in breast cancer

etiology. Finally, BMI has been consistently observed to have paradoxical associations with breast cancer across menopause, with evidence of preventative effects associated with higher BMI in premenopausal women but increased risk in postmenopausal women. We first built on recent analyses that investigated the genetic architecture of testosterone and sex hormone binding globulin (SHBG) in men and women of European ancestry by conducting genome-wide association studies (GWAS) of estradiol concentrations in women. Additionally, we investigated the generalizability of previous findings in women of African ancestry. We further conducted menopausal status specific GWAS of these sex hormones to identify loci with heterogeneous effects across menopause. We found that the strongest overall genetic predictor of testosterone concentrations, located in the CYP3A7 gene, had an effect nearly twice as large in premenopausal women compared to postmenopausal women. Similarly, genetic variants in the AKR1C4 gene were strongly associated with concentrations of SHBG in premenopausal women, but not in postmenopausal women, with a 5-fold difference in effect estimates between the two. We also estimated the shared heritability across menopausal status specific hormone concentrations, and observed a relatively low genetic correlation between pre- and postmenopausal detectable levels of estradiol, whereas comparisons of pre- and postmenopausal shared heritability for SHBG and testosterone were both close to one, indicating near identical genetic architectures. We performed gene-level tests for enrichment of genetic associations within tissue-specific gene expressions by collapsing multiple SNP-level associations in a gene while accounting for linkage disequilibrium. Using this gene-set analysis for tissue specificity we observed a change from strong adrenal gland tissue specificity of testosterone in premenopausal to adipose tissue specificity in postmenopausal women, suggesting that adiposity may play a more important role in determining circulating concentrations of testosterone after menopause. To understand the

directional relationships between overall and menopausal status specific concentrations of sex hormones and BMI on mammographic dense and non-dense area we performed Mendelian Randomization analyses. We created menopausal status specific genetic instruments for SHBG, testosterone, and estradiol based on our previous work. We obtained single nucleotide polymorphisms (SNP)-specific association statistics from a recent GWAS of mammographic density of up to 27,900 women of European ancestry. Effect estimates for BMI were obtained from the largest meta-GWAS of BMI to date, comprising more than 700,000 individuals. We observed an inverse relationship between overall genetically predicted testosterone and dense area. Increasing genetically predicted BMI was strongly associated with an increase in genetically predicted non-dense area, as previously observed. However, we also observed an inverse association between genetically predicted BMI and absolute dense area, which might explain some of the reduced risk of breast cancer associated with an increase in genetically predicted BMI. Higher genetically predicted BMI was also strongly associated with decreasing SHBG concentrations, as well as increasing concentrations of testosterone. Based on the inverse-variance weighted results, we observed increasing genetically predicted BMI to be associated with a decrease in genetically predicted detectable levels of overall and premenopausal specific estradiol concentrations, but not for postmenopausal only. Multivariable MR approaches for the association of BMI and mammographic density adjusting for sex hormones did not substantively change the effect estimates of BMI. Building on the strong association between BMI and mammographic density, we sought to identify genetic loci that interact with BMI to alter mammographic density phenotypes. We conducted genome-wide tests for the interaction between SNPs and BMI on percent mammographic density, absolute dense area, and absolute non-dense area in 14,837 women. Despite having the largest sample size to date with genetic and phenotypic data for mammographic density, we did not find any loci that reached standard Bonferroni correction for statistical significance. This work presents novel findings of the unique genetic architectures of

menopausal specific concentrations of sex hormones in women and extends these findings to investigate their associations with mammographic density. We show that BMI plays an important role in determining not only non-dense area, but also dense area and a possibly separate mechanism for breast cancer etiology. Additionally, there is evidence based on our MR approaches of a regulatory role of BMI on endogenous estradiol as yet another possible pathway to tumorigenesis. We did not identify any genetic variant that has a strong modifying effect of BMI on mammographic density phenotypes. It is possible that larger studies are merited to investigate the interactions between germline genetic variants and BMI on mammographic density variation.

Serum Testosterone, Estrone, Estradiol, and Sex Hormone Binding Globulin Responses in Health Postmenopausal Women Participating in a Flaxseed Intervention Study - Joanna L. Heersink 2004

Steroid-protein Interactions - Ulrich Westphal 1971

Testosterone - Alexandre Hohl 2023

Even though research on testosterone is increasing, there is still much controversy regarding its physiology and clinical use. This book provides a broad overview on testosterone, from its basic features to the most recent evidence of clinical applicability. In addition, specific conditions in which testosterone play a pivotal role are discussed in detail, such as hypogonadism, misuse and abuse, puberty, cardiovascular effects and testosterone therapy. The testes are vital organs for reproduction of the human species, besides being the main source of testosterone production in men. Although not essential for survival, these singular structures represent the essence of male biological function. Testosterone is the most important testicular androgen in men. Low serum testosterone levels are associated with cardiovascular morbidity, metabolic syndrome, type 2 diabetes mellitus, atherosclerosis, osteoporosis, sarcopenia, and mortality. Also, there is increasing evidence that serum testosterone is a major biomarker status of men's health in general. Hypogonadism in a male refers to a decrease in one or both of the two major functions of the

testes: sperm production or testosterone production. These abnormalities can result from disease of the testes (primary hypogonadism) or disease of the pituitary or hypothalamus (secondary hypogonadism). Currently, the clinical features of male hypogonadism are sufficiently well-recognized, the causes are well-known, and the tests of the hypothalamic-pituitary-testicular axis are accurate enough for the diagnosis in most patients. Testosterone, the focus hormone of this book, is used in different forms and routes of administration. Several authors unravel its peculiarities and assist in choosing the most suitable form in each case, as well as the possible risks of its misuse or even abuse in men and women, seeking alternatives to help patients in this situation.

Male Hypogonadism - Stephen J. Winters 2003-12-12

Recent advances in cellular and molecular biology have markedly increased our understanding of normal and abnormal hypothalamic-pituitary-testicular function. Like other volumes in the Contemporary Endocrinology series, the goal of *Male Hypogonadism: Basic, Clinical, and Therapeutic Principles* is to link current knowledge of basic biology to the practice of medicine. The development of new methods for testosterone replacement has substantially increased the number of men who are seeking to determine whether they are hypogonadal, and who are using testosterone replacement therapy, thus mandating a broader understanding of testosterone deficiency. The chapters of this book were contributed by authors from around the world, and from various scientific and clinical disciplines, who have devoted their careers to the study of the physiology and pathophysiology of the male. Thus, this comprehensive and focused volume is intended for a wide audience encompassing both basic scientists and practicing clinicians. Its scope will provide a wealth of information for students and fellows as well.

Hormones, Cognition and Dementia - Eef Hogervorst 2009-09-24

A decade ago, oestrogen-containing hormone therapy was viewed as a promising strategy for the prevention and treatment of dementia and age-related cognitive decline. However, treatment trials in women with Alzheimer's disease showed that oestrogens did not reverse cognitive

impairment, and clinical trials in healthy older women indicated that oestrogens did not prevent cognitive decline. The Women's Health Initiative Memory Study trial even suggested an increased risk of dementia with treatment late in life. What happened? How are we to understand these findings? What are the implications for middle-aged and older women? What about testosterone, and what about men? And where do we go from here? This book brings together world-renowned experts in basic and clinical research on sex steroids, aging, and cognition to integrate existing findings with emerging new data, and offer challenging hypotheses on these key issues.

Abstract: Objective: To develop a validated questionnaire for the assessment of menopausal syndrome in Chinese Medicine and through the analysis of the basic menopausal syndrome classification in Chinese Medicine to explore the use of objective hormone markers as one of the evidence for the Chinese Medicinal classification and guidance for application of herbal medicines by Chinese Medicine Practitioners. Methods: The major symptoms related to typical syndromes of menopause were extracted from Chinese Medicine textbook, international diagnostic guide of Chinese Medicine, classic and contemporary literature of Chinese Medicine and subjective symptoms

were eliminated to facilitate the administration of a self-reported outcome questionnaire. The symptoms related to menopause in Chinese Medicine were identified and redefined to improve the content validity. A total of 353 menopausal women were included in the study. Participants were assessed through face-to-face interview by registered Hong Kong Chinese Medicine Practitioner to complete the questionnaire and serum samples for hormones measurement were collected after an overnight fast in the morning of the assessment day. Serum Estradiol (E2), Testosterone (T), Progesterone (P), Luteinizing Hormone (LH), Follicle Stimulating Hormone (FSH) and Sex-Hormone Binding Globulin (SHBG) were measured by electrochemiluminescence immunoassays (ECLIA). Free estradiol (fE2), non-Sex-Hormone Binding Globulin bound Estradiol (non-SHBG-E2), free Testosterone (fT), and non-Sex-Hormone Binding Globulin bound Testosterone (non-SHBG-T) were calculated to assess hormone availability and activity. E2/T ratio was also calculated to investigate the balance of E2 and T in the body. Results: Principal Component Analysis (PCA) was conducted. Symptoms related to Deficiency of Yin and symptoms related to Deficiency of Yang were extracted and the relationship between the syndromes and E2, T, P, LH, FSH, SHBG, fT, non-SHBG-T, fE2, non-SHBG-E2 and E2/T ratio were investigated. For symptoms related to Deficiency of Yin, E2 (ppppor little with moderate and severe presentation of symptoms. For symptoms related to Deficiency of Yang, SHBG ($p=0.042$, $p=0.002$, pshowed an increase, fT ($p=0.044$, $p=0.049$, $p=0.003$) and non-SHBG-T ($p=0.044$, $p=0.049$, $p=0.003$) showed a decrease which was significant for other three groups while comparing to the no or little group. Conclusion: Menopausal Syndrome Questionnaire was developed and validated in the study. Major syndromes and symptoms involved in the diagnosis of menopausal syndrome in Chinese Medicine were identified and good test-retest reliability was also demonstrated. From the result, we hypothesize that the presentation of symptoms related to Deficiency of Yin may be closely correlated with the menopausal transition in Western Medicine and the presentation of symp

EFFECTS OF FLEXIBLE EXTENDED REGIMENS OF ORAL

CONTRACEPTIVES ON THE VAGINAL ENVIRONMENT - Mingaleva Elmira 2017

Objective: to study the effect of u0435xtended prolonged regimen of combined oral contraception (COC) on the condition of the vaginal environment and the level of sex hormones in women of reproductive age. The study involved 54 women who need contraception aged from 18 to 45 years. The average age was 27.5u00b16.8 years. Before and after 6 months of using the COC the state of the vagina was determined by the degree of purity of the vaginal smear, moisture, and acidity (pH), the condition of the vaginal microbiota, as well as the level of sex hormones in blood. After 6 months of use of COC in u0435xtended prolonged mode normal flora with a predominance of lactobacilli was determined; there was a significant increase in vaginal acidity without change of moisture. Against the background of the use of COC, a significant decrease in the level of estradiol, free testosterone and the index of free androgens, an increase in the level of sex hormone-binding globulin (SHBG) was revealed. A statistically significant correlation between vaginal acidity, the level of estradiol, free testosterone and the index of free androgens, a negative correlation between the level of SHBG were revealed. On the moisture content of the vagina the level of estradiol influenced significantly. Conclusion. The use of u0435xtended prolonged regimen of COC for 6 months contributes to the dominance of lactobacilli in the vagotype, increasing the acidity of the vagina against the background of a decrease in the level of estradiol and testosterone.

Androgen Action - Fahri Saatcioglu 2011-08-09

Androgens play a critical role in the development and maintenance of the male reproductive system and affect important physiological processes and pathological conditions, including the homeostasis of the normal prostate and prostate cancer. Androgen Action: Methods and Protocols is designed to provide a tool box to study various phases of androgen action, from its entry to the cell to the phenotypic response that the cell mounts, with up-to-date techniques for biochemists, molecular biologists,

cell biologists, geneticists, and pathologists. The volume opens with a brief review of the research history on androgen action and prostate carcinogenesis, followed by chapters that cover state-of-the-art methods to determine androgen levels in biological tissues and fluids, experimental procedures to study the various aspects of androgen receptor activity, and methodology to study salient examples of interactions between androgen signalling and other major signalling pathways in cells. Written in the successful *Methods in Molecular Biology*TM series format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible protocols, and notes on troubleshooting and avoiding known pitfalls. Authoritative and easily accessible, *Androgen Action: Methods and Protocols* provides a comprehensive overview of, and practical guidance on, the diverse methodologies that are propelling androgen action research forward, both for normal physiology as well as in disease states.

SEX HORMONES IN DRUG-NAIVE, FIRST-EPISODE PATIENTS WITH PSYCHOSIS - Andreas Karampas 2017

Sex differences have long been reported in schizophrenia leading to the hypothesis that sex hormones may be implicated in the pathophysiology of the disorder. We assessed gonadal hormones during the fasted state in drug-naïve patients with psychosis. Fasting serum concentrations of follicular-stimulating hormone (FSH) and luteinizing hormone (LH), testosterone, free-testosterone, Sex Hormone Binding Globulin (SHBG) and estradiol (E2) were compared between a group of 55 newly diagnosed, drug-naïve, first-episode men with psychosis and a group of 55 healthy controls, matched for age, smoking status and BMI. Testosterone and free-testosterone levels were significantly lower in the patients' group and SHBG levels significantly higher in the patients' group compared to those in healthy controls. Testosterone, free-testosterone and SHBG were compared between a group of 32 drug-naïve, first-episode females with psychosis and a

group of 32 healthy controls matched for age, smoking status and BMI. The groups had similar values in the hormones which were measured.

Fertility Preservation in Male Cancer Patients - John P. Mulhall 2013-02-21

Men with cancer rendered infertile by surgery, chemotherapy, radiation and hormone therapy that are needed to control or cure their disease are increasingly being offered the chance to preserve their reproductive potential through artificial reproductive technologies. Cryopreservation of sperm and testicular tissue have increasingly helped boys and men preserve their fertility. There is a growing subspecialty within reproductive medicine aimed at fertility preservation in this population. Furthermore, strategies are being developed that may in the future revolutionize the approach to such patients. Written by international authorities in the field of fertility preservation, this comprehensive book is aimed at clinicians dealing with male cancer patients, in particular, urologists, andrologists, oncologists, pediatricians and nursing staff as well as clinicians in reproductive endocrinology. The text reviews the impact of cancers and their treatment on male fertility, the available fertility preservation strategies and post-treatment management.

Advances in Research and Applications - Gerald Litwack 2000-01-27

Under the capable and qualified editorial leadership of Dr. Gerald Litwack, *Vitamins and Hormones* continues to publish cutting-edge reviews of interest to endocrinologists, biochemists, nutritionists, pharmacologists, cell biologists, and molecular biologists. First published in 1943, *Vitamins and Hormones* is the longest-running serial published by Academic Press. In the early days of the Serial, the subjects of vitamins and hormones were quite distinct. Now, new discoveries have proved that several of the vitamins function as hormones and many of the substances inferred by the title of the serial function in signal transduction processes. Accordingly, the Editor-in-Chief has expanded the scope of the serial to reflect this newer understanding of function-

structure relationships in cellular communication. The Editorial Board now reflects expertise in the field of hormone action, vitamin action, X-ray crystal structure, physiology, and enzyme mechanisms.

Testosterone and Aging - Institute of Medicine 2004-03-12

Popular culture often equates testosterone with virility, strength, and the macho male physique. Viewed by some as an "antiaging tonic," testosterone's reputation and increased use by men of all ages in the United States have outpaced the scientific evidence about its potential benefits and risks. In particular there has been growing concern about an increase in the number of middle-aged and older men using testosterone and the lack of scientific data on the effect it may have on aging males. Studies of testosterone replacement therapy in older men have generally been of short duration, involving small numbers of participants and often lacking adequate controls. Testosterone and Aging weighs the options of future research directions, examines the risks and benefits of testosterone replacement therapy, assesses the potential public health impact of such therapy in the United States, and considers ethical issues related to the conduct of clinical trials. Testosterone

therapy remains an attractive option to many men even as speculation abounds regarding its potential.

Androgens and the Aging Male - B.J. Oddens 1996-11-15

While menopause in women is a well-established and well documented phenomenon, the andropause in men is a relatively new concept. The terms male menopause and andropause suggest that this is an abrupt phenomenon related to a sudden deprivation of sex hormones. Unlike the menopause, which has a relatively sudden onset, the andropause appears to be a gradual process. It has been hypothesized that an androgen deficiency might develop with aging. *Androgens and the Aging Male* explores this hypothesis. The book focuses on the gradually progressive problems related to the decline in androgens that can occur with advancement of age. It examines the debate about the extent to which an age-dependent decline in androgens leads to health problems that affect or impair the quality of life, and the theory behind it. In addition, it reviews studies evaluating the effects of androgen supplementation. *Androgens and the Aging Male* comprehensively covers androgen function and how it changes over time.
