*A Model of Urinary Tract Infection in Male Mice Reveals Sex-based Differences in the Innate Immune Response to Uropathogenic Escherichia Coli* - Anna Zychlinsky Scharff 2021

## Sex Differences in Uropathogenic Escherichia Coli Urinary Tract Infection - Patrick David Olson 2018

Urinary tract infections (UTIs) are among the most common bacterial infections which plague humans. Community-onset UTI is widely viewed as a disease only of women; indeed, its occurrence between 2 and 60 years of age is almost exclusive to females. However, the disease also affects substantial male patient populations, namely infants and the very elderly. While female cases of complicated and upper-tract UTI (pyelonephritis) outnumber male cases overall, men carry an increased risk of mortality from these infections. Sex differences in UTI epidemiology have heretofore been attributed almost entirely to anatomic and hygienic factors in females, including the permissiveness of surrounding environments to microbial colonization, shorter urethral length, and shorter distance from anus to the urethral meatus. However, these hypotheses and potential mechanisms driving sex differences in UTI have not been investigated due to a lack of preclinical models allowing sex comparisons. In response to this deficit, we devised a minimally invasive surgical bladder inoculation technique that yields

reproducible upper and lower UTI in both male and female mice. Acute uropathogenic *Escherichia coli* (UPEC) infection in males of two mouse strains recapitulated the intracellular bacterial community pathway previously shown in females. Compared with females, C3H/HeN males displayed a striking predilection for chronic cystitis, manifesting as persistent bacteriuria, high-titer bladder bacterial burdens, and chronic inflammation as previously characterized in catheter-infected C3H/HeN females. Further, males developed more severe pyelonephritis, as well as nearly 100% penetrant renal abscesses, a complication that is rare in female mice. Within the abscess, UPEC formed a dense nidus of intratubular, biofilm-like communities that appeared sheltered from surrounding inflammatory cells by a fibrotic capsule. The formation of these abscess communities required type 1 pili, a major urovirulence determinant in the bladder but not previously implicated in pyelonephritis. Severe ascending UTI in males was sharply abrogated following castration, but complemented with exogenous testosterone. Similarly, administration of exogenous testosterone in C3H/HeN females imparted susceptibility to severe pyelonephritis and abscess formation. Susceptibility to severe UTI was also induced in both sexes with 5- $\alpha$ -dihydrotestosterone or attenuated by treatment with the antiandrogen flutamide. Further, male mice lacking a functional androgen receptor were protected from severe upper-tract UTI. Collectively, these data show that specific activation of the androgen receptor augments severity of UTI in both sexes. Our mini-surgical model provides a new preclinical platform for translatable studies of UTI pathogenesis in both male and female hosts, specifically expanding studies of pyelonephritis, ascending renal abscess development, and the treatment of complicated UTI. The discovery of intratubular UPEC communities in this model offers a first look at early renal abscess pathogenesis and helps to explain the need for prolonged antimicrobial treatment during severe pyelonephritis. Further, our findings suggest that modulation of androgens may represent a novel therapeutic route to combat recalcitrant or recurrent UTI, and may help to explain why certain patient populations are more likely to develop UTI.

*Urinary Tract Infections in Pregnancy* - Shipra Sudam Sonkusare 2010-07

Attention to pregnant women has been increasing in health care. One of the important problems in pregnancy is urinary tract infection, as neglecting the treatment of urinary tract infection can result in health and economic problems. Changes in sex hormones and anatomic and physiologic changes lead to increased risk of bladder and kidney infection in pregnancy. Very little academic literature exists on the prevention aspect of urinary tract infections as safety of various agents during pregnancy has not been well studied, and hence hesitation to use any of these for the purpose of prophylaxis or treatment remains. This book provides the evidence based review regarding safety of various agents for prophylaxis and treatment of urinary tract infections in pregnancy. This should help in wider usage of safer agents, thus reducing the prevalence and complications of urinary tract infections in pregnancy.

*Urinary Tract Infection Cure and Treatment Manual* - Dr Betty King 2023-02-07

Urinary tract infection (UTI) is common in women and men. It is caused by bacteria that move from the urethra (urine canal) through the bladder and into the ureters (a tube that carries urine from the kidneys to the bladder). UTI can cause fever, fatigue, and feeling stuffed up. It can also lead to a UTI infection in the bladder (cystitis) or the kidney (pyelonephritis). UTI is most common in people over 50 years old and those with a weak immune system. It is also more common in people who have had a UTI before. UTI is treated with antibiotics. If a sexually transmitted infection causes a UTI (STI), antibiotic treatment will not cure the infection. Still, it will help prevent the infection's spread to other people. UTI is a severe infection that can lead to long-term problems if not treated correctly. Anyone can get a UTI, but it is more common in people who are elderly, have a weakened immune system, or have a history of UTI. UTI is also more common in people who have sex with other people. Urinary tract infection (UTI) is an infection of the urinary tract, which is the system of organs and tissues that transports urine from the kidneys to the bladder. Infection with a UTI can cause urinary tract pain, discomfort, and a burning sensation when you urinate.

If left untreated, a UTI can lead to more severe problems, such as kidney infection and even a UTI abscess. UTIs are very common, and they can occur at any age. But they are ubiquitous in women and are also more likely to occur in people with a history of UTIs. Bacteria usually cause UTIs, but viruses can also cause them. There are many ways to get a UTI.

**Reproductive Tract Infections** - Adrienne Germain 2013-06-29

Reproductive tract infections (RTIs) have become a silent epidemic that is devastating women's lives. Each year, thousands of women die needlessly from the consequences of these infections, including cervical cancer, ectopic pregnancy, acute and chronic infections of the uterus and the fallopian tubes, and puerperal infections. For many women, this happens because they receive medical attention too late, if at all. The terrible irony of this tragedy is that early diagnosis and treatment for many RTIs do not require high-technology health care. For the hundreds of millions of women with chronic RTIs acquired from their sexual partners, life can become a living hell. Infection is a major cause of infertility, and it leads to scorn and rejection in many countries. These women may experience constant pain, have festering lesions of the genital tract, be at enhanced risk of secondary diseases, and endure social ostracism. The problems associated with RTIs have grown even greater in the past decade with the emergence of human immunodeficiency virus (HIV) and AIDS. Preexisting sexually transmitted disease, particularly when associated with genital tract ulcers, raises women's vulnerability to the transmission of HIV 3-5 fold.
