Matrix Seriation - John R. Triggs 1998

The thesis contends that the underlying principles of stratigraphy and seriation are in need of revision. This is because both methods are incapable of addressing situations where the archaeological record is characterised by complex stratigraphy. Particularly on sites where architecture is present, the stratigraphy is often 'multilinear' consisting of several separate sequences of occupation. Where this occurs, the relationship of events occurring on separate 'lines' cannot be organised into a relative order using the principle of superposition. Artifact studies offer a potential solution to this problem but, such studies are grounded on the assumption of assemblage integrity. Seriation, the relative ordering of assemblages based on similarities between artifact types or attributes, is based on the underlying principle that artifacts contained in the assemblage are 'indigenous,' having been discarded at the time that the deposit was formed. A systematic study of site-formation processes indicates, however, that there are many factors responsible for the transformation of assemblage content following deposition.

Consequently, objects in the assemblage that are non-indigenous (termed infiltrated and residual) can, in many cases, significantly alter the results of the seriation. The problem is compounded by the fact that, at present, there are no means of distinguishing between indigenous and non-indigenous remains within the assemblage. Results obtained by the uncritical application of seriation, therefore, may be spurious except in cases where assemblage integrity can be demonstrated. The thesis offers a solution to the problem of relative dating on sites characterised by complex stratigraphy by combining a technique of stratigraphic analysis referred to as the Harris matrix (developed by Edward Harris, 1973) and computerised seriation. The Harris matrix method is useful in that it offers a means of representing, schematically, the multilinear stratigraphic sequence characteristic of sites with complex sequences of occupation. Computerised seriation is applied as a way to order the events occurring on separate occupational sequences. Artifact assemblages used in the seriation represent indigenous remains, all non-indigenous remains having been removed prior to seriation. The procedure forms the basis of a relative dating technique referred to as 'Matrix Seriation.'

Physical Geology - Steven Earle 2016-08-12

This is a discount Black and white version. Some images may be unclear, please see BCCampus website for the digital version. This book was born out of a 2014 meeting of earth science educators representing most of the universities and colleges in British Columbia, and nurtured by a widely shared frustration that many students are not thriving in courses because textbooks have become too expensive for them to buy. But the real inspiration comes from a fascination for the spectacular geology of western Canada and the many decades that the author spent exploring this region along with colleagues, students, family, and friends. My goal has been to provide an accessible and comprehensive guide to the important topics of geology, richly illustrated with examples from western Canada. Although this text is intended to complement a typical first-year course in physical geology, its contents could be applied to numerous other related courses.

Exploration of Subsurface Antarctica - M.J. Siegert 2018-01-08

Our appreciation of glaciological processes in Antarctica suffers from a lack of observations in regions where numerical models indicate the ice sheet to be susceptible to ocean and/or atmospheric warming. The solution lies in the use and development of glacier geophysics. In this volume we present a series of papers that demonstrate how geophysics can be deployed in Antarctica to comprehend: (1) boundary conditions that influence ice flow such as subglacial topography, the distribution of basal water and ice-sheet rheology; (2) phenomena that might affect ice-flow processes, such as complex internal ice-sheet structures and the proposition of large stores of hitherto unappreciated groundwater; and (3) how glacial sediments and formerly glaciated terrain on, and surrounding, the continent can inform us about past ice-sheet dynamics. The volume also takes a historical view on developments leading to current knowledge, examines active ice-sheet processes, and points the way forward on how geophysics can advance quantitative understanding of Antarctic ice-sheet behaviour.
