Entity-relationship Approach to Software Engineering Carl G. Davis 1983

Database Systems in Science and Engineering J.R Rumble 1990-01-01 Computerized databases provide a powerful everyday tool for data handling by scientists and engineers. However, the unique nature of many technical tasks requires a specialized approach to make use of the many powerful commercial database tools now available. Using these tools has proved difficult because database technology is often shrouded in layers of jargon. An essential guide for scientists and engineers who use computers to avoid drowning in a flood of data, Database Systems in Science and Engineering dispels the myths associated with database design and breaks the barriers to successful databases. Using the language of scientists and engineers, this book explains concepts and problems, offers practical steps and solutions, and provides new ideas for better data handling. The first part of the book presents an overview of technical databases using examples taken from real applications and the current state of technical databases. The second part covers the computer implementation of technical databases, including examples and the necessary computer science theory to form a sound background. The authors confront the many difficulties that arise in the design and implementation of a realistic database and offer solutions to these challenges. Before beginning any database project, scientists and engineers should read this book to understand how to make every database

Conceptual Modeling - ER 2009 Alberto H. F. Laender 2009-11-09 Conceptual modeling has long been recognized as the primary means to enable software development in information systems and data engineering. Conceptual modeling provides languages, methods and tools to understand and represent the application domain; to elicit, conceptualize and formalize system requirements and user needs; to communicate systems designs to all stakeholders; and to formally verify and validate systems design on high levels of abstraction. Recently, ontologies added an important tool to conceptualize and formalize system specification. The International Conference on Conceptual Modeling - ER - provides the premiere forum for presenting and discussing current research and applications in which the major emphasis is centered on conceptual modeling. Topics of interest span the entire spectrum of conceptual modeling, including research and practice in areas such as theories of concepts and ontologies underlying conceptual modeling, methods and tools for developing and communicating conceptual models, and techniques for transforming conceptual models into effective implementations. The scientific program of ER 2009 features several activities running in parallel.

Information Technology in Educational Management A.J. Visscher 2013-04-17 Although a few books are available on the use of computers in the school office, this book is the first one addressing the topic of computer-assisted school information systems (SISs) for an international audience, based on both practical and scientific international collaborative research. This book: analyzes the nature of SISs, their intended benefits and history; presents the development strategies and the characteristics of three SISs that are widely used in various parts of the world; reviews what has been learned from the research over the last decade to inform successful design and implementation of SISs; presents exciting perspectives on the future of SISs from experts, vendors, and users; and reflects on what needs to be done to promote the full utilization of SISs by clerical and managerial school staff through better system design, user support, and continuing research. The book has been written for an international audience of students, researchers, system designers and implementers, practitioners and policy-makers in developing as well as in developed countries. It will also be of benefit to professionals in the field of school administration and school management to help them promote better use of SIS in their own context by learning from the experience of others.

Educational Loan Scheme Management System Jacob Olanya Ocen 2011-12 This study was made on Educational Loans Management, researchers have identified that many of the students in Uganda drop out of school at the higher level of learning due to lack of funds and as result, majority of Ugandans fail to complete their education at its final stages. There is therefore a need to avail loans to the students who have been admitted at these institutions as a remedy to this problem. This further creates another question of how these loans are going to be managed that is, track the disbursements and payments so as to make the system efficient and sustainable. The answer to this question was the development of an Educational Loan Management System. The methodologies used in collecting data included reading about how similar kinds of systems has been implemented and managed in countries that offer educational loans and then relating them with our country's situation to find the best way to implement a similar system that would be efficient despite the different economies. The proposed system was designed using the data model and the process model, using the Entity Relationship Diagram and the Data Flow Diagram respectively.

Data Base Management System Mr. S. Sureshkumar 2022-09-26 A database is a collection of data that are connected. Databases allow for the efficient retrieval, insertion, and deletion of data from the database. Additionally, databases arrange the data in the form of tables, views, schemas, reports, and other such things. For instance, a university database would categorize the data on students, teachers, and administrative staff, among other categories, which will aid in the effective retrieval, insertion, and deletion of data from the database. The database management system (DBMS) is in charge of managing the data; the database engine enables users to access, lock, and modify data; and the database schema outlines the logical structure of the database. These three fundamental components assist ensure concurrency, security, the integrity of data, and standardized

methods for the administration of data. The database management system provides support for a wide variety of duties that are often associated with database administration. These tasks include change management, performance monitoring and tuning, security, backup and recovery, and more. The majority of database management systems are also responsible for automatic rollbacks and restarts, as well as the recording and auditing of activity in databases and the applications that use them. Other responsibilities of these systems include logging and auditing database activity. A centralized view of the data is provided by the DBMS. This view may be accessed in a controlled way by numerous users from various places at the same time. A database management system (DBMS) may restrict the data that end users see and how they see the data, offering many perspectives on a single database structure. Because the DBMS processes all requests, end users and software programs do not need to be aware of where the data is physically located or on what kind of storage media it is stored because the DBMS does all of the work for them. This book contains chapters and topics that cover all of the necessary information that is associated with “Data management system”. After doing a great deal of study on the subject, the author decided to add the content that is now included in this book. After engaging in a great deal of conversation, the writers of this book contributed all of the material that is included in this book. This book contains a lot of material that will assist readers in gaining a better understanding of all the chapters.
