

Sex Ratio Trend

Trends and Determinants of Child Sex Ratio in India - P. S. Nanzy 2012

[An Empirical Test of Three Hypotheses Concerning the Human Sex Ratio at Birth in the United States, 1915-1948](#) - Chalmers Alexander McMahan 1951

[Sex Ratio of Silchar](#) - Dibyojyoti Bhattacharjee 2010

Sex ratio which is defined in India as the number of females per thousand males is in a decreasing rate in India. Like many third world countries sex preference of the parents towards the male child exists in India. Female infanticide is a social evil and is practiced in several societies of the country. With the advances of medical science this evil has taken a new shape. However, there are some societies in the country who are not over powered by

this evil. The paper discusses one such society.

Population Studies of Human Sex Ratio Patterns in the United States: Cross-cultural Trends and Impact of Prenatal Care - Amy R. Volpert 2011

The Descent of Human Sex Ratio at Birth - Éric Brian 2007-07-24

This is an attempt to renew our links with the oldest traditions of scholarly thinking, but is also a well-tempered reflection on today's work in objectivization. After a deconstruction of the past and present conditions of scientific understanding of human sex-ratio at birth, the authors propose a reconstruction of the dynamics of the phenomenon based on stochastics. Appendices provide information on the first expression of sex ratio trends,

as well as a comparison of Darwin's treatments of the subject.

Sex Ratio at Birth in Viet Nam - 2011

Local Mate Competition and the Sex Ratios of Malaria Parasites, with a Focus on Plasmodium Mexicanum - Allison T. Neal 2014

Sex ratio theory is a focus in evolutionary biology that explores how natural selection shapes investment in males and females. It has provided some of the best quantitative evidence of evolution and could find utility in public health efforts through its application to malaria parasites. These parasites have distinct male and female forms that are produced following massive asexual replication, and they mate within the blood-feeding insects that transmit them between vertebrate hosts. A very similar population structure is assumed by local

mate competition (LMC), a model from sex ratio theory that predicts female-biased sex ratios dependent on the degree of selfing within a mating patch. In this dissertation, I test a series of predictions from LMC for the lizard malaria parasite *Plasmodium mexicanum*. These include: (i) sex ratios have heritable variation that is not constrained by other life history traits; (ii) single-genotype infections have female-biased sex ratios that are determined by male fecundity; (iii) multiple-genotype infections have less biased sex ratios than single genotype infections; (iv) if males are limiting, sex ratios may be less biased when there are fewer parasites present (an extension of LMC called fertility insurance); and (v) less biased sex ratios may also be favored if increased female production yields diminishing returns on transmission to a new vertebrate host. To test these predictions, I combined the study of natural and experimental infections,

legacy.opendemocracy.net
on 2021-07-07 by guest

microscopy (parasite density and sex ratio), molecular genetics (infection genetic diversity), and mathematical modeling (of how transmission patterns might affect sex ratio evolution). Overall, the results were qualitatively consistent with both LMC and my new model predictions. Sex ratios showed evidence of heritable variation that was unlinked to other life history traits measured. Sex ratios in single-genotype infections were female biased and consistent with the male fecundity observed, and were lower than sex ratios in experimental multiple-genotype infections, as predicted. Sex ratios were not less biased with lower sexual cell density, suggesting that males were not limiting. In fact, the opposite trend was sometimes observed: sex ratios were less biased with more sexual cells. This pattern has been observed previously in this and other species, and the only model that currently predicts such a trend is the new transmission model I outline. This dissertation

contributes to our understanding of sex ratio evolution for malaria parasites in a number of ways. First, it adds evidence to the idea that the selective forces implicated in LMC are at work in malaria parasites and that malaria parasites are able to detect and respond to relevant cues. Second, it helps account for discrepancies in existing data, which have often reached conflicting conclusions. Third, it offers one of the first detailed studies of malaria parasite male fecundity, an essential piece of the sex ratio puzzle. Finally, it outlines a new theoretical extension of LMC that provides novel predictions and highlights areas of study that may be fruitful for future work on malaria parasites and other organisms.

Analysis. Trends and Determinants causing Gender Imbalance in India -

Ramanpreet Kaur Nayyar
2017-11-14

Research Paper (postgraduate) from the year 2017 in the subject Economics - Case Scenarios, grade: -, Doon University, language: English, abstract: Evidences show that many states in our country have shown wide variations in the gender balance.

Throughout its long history, India experiences wide variety of cultures and traditions. However, it is unfortunate that this transitional phase led to creation of a culture where women are treated inferior to men. Also, it has been seen that the ideology and perception further differs on the basis of geographical areas too. On one hand, in a matriarchal society under southern parts, women are treated as leaders and natural heirs whereas on the other hand in northern parts they are not even allowed to born. It is also noticed that states differ in sex ratio on the basis of

literacy as well. In this context, the present study aims to analyze the trends and their determinants of the skewed distribution among the states and the union territories of the country.

Recent Change in the Sex Ratio at Birth in Viet Nam - 2009

'Rising Sons' and 'Setting Daughters' - Suddhasil Siddhanta 2017

Despite century old concern and debate child sex ratio patterns have shown an alarming increase over the last two decades, more so during 1991 to 2001. The pattern of increase in child sex ratio though erratic up to the first half of the last century, shows consistent rise at least since 1961. As these groups are the 'feeder source' of adult population in future, such trend if unchecked, 'will continue to haunt the society in decades to come' until and unless corrective measures are taken. Growing child masculinity in contemporary India and its regional

penetration forced the policy makers and demographers to recognize the reality of human interferences behind the recent increase in child sex ratios. Out of the different types of interferences, most talked about is the 'sex selective abortion' that gained currency during 1980s and more so in the 90s. However the practice of sex selective abortion of unwanted foetus is still more pronounced in the north and north western¹ part of the country more so in some relatively prosperous areas or among the prosperous households. Employing spatial interpolation technique (say, kriging), the present paper tries to analyze the geographical structure of child sex ratio and its changing pattern over time. The analysis indicates, far from being random, the child sex ratios in India seem to be continuous over space showing robust clustering of high masculinity in child population on one hand and its systematic (spatial) increase on the other. The spread as well as intensity of

growing masculinity in child population clearly endorses that from a regional perspective the problem regarding excessive maleness in the population is rapidly being surfaced as a national problem needs to tackle with greater resources. Such spatial patterning of child sex ratios clearly hints that diffusion of sex selection might be well entrenched in Indian population with sufficient degree of regional diversity. The study endorses the importance of contextual policy and advocacy measures to arrest the increasing trend of masculinity as it will affect population dynamics not only in the regional or national context but also in the broader spectrum of international arena. This should be a matter of concern for policy makers, researchers and activists alike.

Census 2011 and Child Sex Ratios in Tamil Nadu - Sharada Srinivasan 2011

Provisional estimates based on Census 2011 show that the sex ratio in the age group 0 to 6 in India continued to decline, from 927 in 2001 to 914 in 2011. Contrary to the national trend, the 0-6 sex ratio for Tamil Nadu has registered an increase for the first time since 1961, increasing from 942 in 2001 to 946 in 2011. On the basis of an analysis of district-level data and geographic prevalence of interventions, the paper shows that the increase in 0-6 sex ratios comes from districts where government and NGO efforts were concentrated to tackle daughter elimination.
