Adolescent Gynecology - Alfred Bongiovanni 2013-11-11

ABOUT THE SUBJECT MATTER Adolescence is a time of significant change. The adolescent era spans the interval between childhood and adulthood. It is a time of physical, social, and even emotional upheaval. During this relatively brief period of time not only does physical growth

accelerate but, of more significance in the biology of any species, the individual attains reproductive maturity. Within this time frame, the human being acquires the capacity to procreate and perpetuate our species. From a reproductive standpoint, throughout adolescence the individual is being prepared for perhaps what might be considered the most important function an organism has during his/her brief sojourn on earth, namely to endow successor(s) with a minute quantity of DNA to enable continuation of its form of life. The interlude between childhood and adulthood is not always socially or emotionally simple. The anatomic and physiologic modifications that come to pass during adolescence are not necessarily paralleled by a capacity to assume the societal responsibilities associated with reproductive maturity. Although the physiologic changes normally proceed in a predetermined fashion, adaptation to a changing role is a far more trying process. Accustomed to living in a child's world, the subject of adolescent change requires considerable time and understanding to facilitate existence in the adult world. The early stages of sexual awareness, for example, are generally extremely confusing and, as evidenced by the inordinately high frequency of teenage pregnancy and sexually transmitted diseases, can be extraordinarily dangerous.

Laboratory Diagnosis of Sexually Transmitted Diseases - E. van Dyck 1999

This manual provides an authoritative guide to standard laboratory procedures for detecting and diagnosing sexually transmitted diseases. Addressed to clinical microbiologists and medical technologists, the manual is designed to serve as a practical bench aid, tuned to the needs

and capacities of laboratories at different levels in the health system. Although the standard procedures described have universal relevance, particular attention is given to conditions in developing countries, where rapid transport of specimens may not be possible and cost factors may be decisive. Recommended procedures, tests, and techniques are supported by close to 150 references. Noting the constraints on staff and resources faced by most laboratories throughout the world, the manual concentrates on tests known to yield essential diagnostic information. Standard antimicrobial susceptibility tests are described for those diseases where drug resistance is a problem. Although the major emphasis is on procedures for diagnosis, case-finding, and test-of-cure, some procedures useful in epidemiological research are also included. The manual has nine chapters covering the full range of sexually transmitted diseases: gonorrhoea "Chlamydia trachomatis" infection, syphilis, genital herpes, chancroid granuloma inguinale, vaginitis in adults, human papillomavirus infection, and human immunodeficiency virus. Each chapter opens with a brief description of the disease and the principal laboratory approaches to diagnosis, followed by detailed advice on the collection and transport of specimens. Against this background, all relevant laboratory methods, from microscopy, culture and non-culture techniques to serology and the use of commercial test kits, are described in detail, with colour plates used to illustrate selected procedures and results. Apart from providing detailed step-by-step instructions for each procedure, the manual offers abundant practical advice on the selection of tests, their comparative sensitivity, and specificity, the degree of skill required, the correct interpretation of results, and common errors and how to avoid them. The chapter on HIV infection reproduces the latest joint UNAIDS and WHO recommendations for the selection and use of HIV antibody tests. Further practical guidance for each of these diseases is provided in three annexes, which summarize appropriate diagnostic tests at different levels of the laboratory system, describe the media, reagents, and stains required for the tests, and list all the basic products needed to prepare essential reagents and media.
