Urolithiasis - Margaret S. Pearle 2009-09-29 Urolithiasis, or stone disease occurs in 7% of women and 12% of men at some point, and these statistics are rising. Furthermore, for those who form a stone, the likelihood of a recurrence is nearly 50% within 5 years of initial diagnosis. Therefore, the need for effective, minimally invasive alternatives for stone eradication and prevention is critical. Because stone disease comprises a large part of any urologist's practice, a thorough knowledge of the pathogenesis and pathophysiology of stone disease is critical in order to understand and implement treatment strategies to prevent stone

formation. Likewise, a working knowledge of the surgical treatments, instrumentation and outcomes is necessary to arm patients with sufficient information to make an informed decision and to provide the appropriate treatment modality for a given stone situation. In Urolithiasis: Medical and Surgical Management, the authors provide a complete guide to the management of stone disease from both a medical and surgical prospective. This book should be an invaluable resource for those who treat stone disease in any capacity, whether surgically or medically, acutely or long-term. *Nutritional and Medical Management of Kidney Stones* - Haewook Han 2019-07-12

Low Oxalate Diet Cookbook - Johnson Mayor
2021-01-13

Low Oxalate Diet May Help Prevent Kidney Stones Kidney stones are a common disorder of the urinary tract. Kidney stones are pieces of stone-like material that form on the walls of the kidney. They are caused by a buildup of minerals in urine. Most stones are so small that they pass through the urinary system without pain.

However, a large enough stone can cause extreme pain or urinary blockage. This is very painful, and requires treatment or surgery. In the United States, about 1 million people get kidney stones every year. Stones usually affect people between the ages of 20 and 40. They affect men more often than women. You may also be at risk if you have a family history of kidney stones. Some people have kidney stones made from calcium oxalate (OX-uh-layt). For these people cutting back on high-oxalate foods and salt may help prevent kidney stones. On a low oxalate diet, you should limit your oxalate to 40 to 50 mg each day. Oxalate is found in many foods. The following charts will help you avoid foods high in oxalate. They will help you eat foods low in oxalate. This may help prevent kidney stones. Be sure to drink plenty of fluids. People likely to get kidney stones should drink 8 to 13 cups of fluid each day. Your body may turn extra vitamin C into oxalate. Avoid high doses of vitamin C supplements (more than 2,000 mg of vitamin C per day) In the following charts, food and drink serving sizes are 3.5 ounces (100 grams), unless otherwise noted.

Animal Models for the Study of Human Disease - Saeed R. Khan 2013-05-29

Most kidney stones consist of crystals of calcium

oxalate (CaOx) and/or calcium phosphate (CaP), and develop on nidi present on renal papillary surfaces. Stone formation is the last stage in a long process starting with development of supersaturation followed by nucleation, growth, aggregation and retention of crystals within the kidneys. A number of animal models utilizing mice, pigs, rabbits and rats, (the most common model), have been developed to understand stone pathogenesis. Animals produce crystalline deposits in the kidneys rather than typical stones attached to the papillary surface. Still, there are many common features between human and rat CaOx nephrolithiasis. Both kidney stones in humans and crystal deposits in the rats have an organic matrix comprised of lipids, carbohydrate and proteins. The crystallization in both human and rat kidneys is modulated by molecules such as osteopontin, Tamm-Horsfall Proteins, inter-alpha-inhibitor, and prothrombin fragment-1 and is associated with enzymuria of proximal tubular origin. Hyperoxaluria, hypercalciuria, hypomagnesuria and hypocitraturia are implicated in both humans and rats. CaOx stones/renal deposits are common in males of both species while females of both species produce CaP stones/renal deposits.
