**Data portability and relation management in social web applications** - Sören Weber 2008-12-03

Inhaltsangabe: Introduction: Recent years have witnessed the great popularity of online social networking services, in which millions of members publicly articulate mutual friend- ship relations. Social network services have become a major application in the internet. Correspondingly the number of provider such social net- work services

has multiplied and accommodates estimated 272 million users worldwide (Universalmccann, 2008). The mass adoption of social networking websites points to an evolution in human social interaction. These sites let the user create an identity namely their profile, which they fill with personal information. These identities can then be searched and relationships among the users can be made. A user can make friends virtually and by that creates his own social circle, that is why it can also be regarded as a reflection of the real world. Most of the users are part in more than one social network, which creates problems in terms of identity and relation management. At the moment there seems to be no consolidation among the services, but a further fragmentation and by that also a fragmentation of information. In the real world people can be easily identified, but this is not possible in the internet as there is no physical contact. People using assumed names as an identifier which may be different on every platform. On top of this it is difficult to manage all the contacts which are spread over several services. At the moment the social network services do not offer ways to get the data out of their platforms to reuse it somewhere else. The use of separate networks may be wanted by the users regarding order and different roles they can slip into. In spite of these aspects there is an increasing demand for reusing and sharing the contact data to be able to manage the online friendships . To overcome the disadvantages of fragmented data central storage has to be established. In combination with exchange mechanisms it would make data reusable, which means all the social networks the user is part of could be synchronised. This is especially useful when entering a new network. It is like moving into a new city and already know some people. Inevitable for such a scenario is that the information of the social networks are portable and that the user can be uniquely identified. There are efforts to achieve this goal, but up to now only partial problems have been solved. An overall concept seems not possible at the moment due to [...]

designed for students preparing for various competitive examinations. It will also be helpful for those preparing for midterm exams in schools or universities. The aim of this book is twofold: first, to help the students preparing for competitive examinations, seeking admission to universities or schools, or prepare for job interviews. Second, it will also be helpful for those studying INFORMATION TECHNOLOGY. This book contains more than 16312 questions from the core areas of INFORMATION TECHNOLOGY. The questions are grouped chapter-wise. There are total 11 chapters, 92 sections and 16312+ MCQ with answers. This reference book provides a single source for multiple choice questions and answers in INFORMATION TECHNOLOGY. It is intended for students as well as for developers and researchers in the field. This book is highly useful for faculties and students. One can use this book as a study guide, knowledge test questions bank, practice test kit, quiz book, trivia questions . . . etc. The strategy used in this book is the same as that which mothers and grandmothers have been using for ages to induce kids in the family to sip more soup (or some other nutritious drink). The children are told that some cherries (their favourite noodles or cherries ) are hidden somewhere in the bowl, and that serves as an incentive for drinking the soup. In joint families, by the time the children are old enough to know the trick played by their grandma, there is usually another group of kids ready to fall for it! They excite the kids, but the real nutrition lies not in the noodles but in the soup. The problems given in this book are like those noodles/cherries while solving all these problems are nutritious soup. Now it is your choice to drink the nutritious soups or not!!!.

*Data Management Systems* - Bhavani Thuraisingham 1997-05-19

As the information contained in databases has become a critical resource in organizations, efficient access to that information and the ability to share it among different users and across different systems has become an urgent need. The interoperability of heterogeneous database systems- literally, the ability to access information between or among differing types of databases, is the topic of this timely book. In the last two decades, tremendous improvements in tools and technologies have

resulted in new products that provide distributed data processing capabilities. This book describes these tools and emerging technologies, explaining the essential concepts behind the topics but focusing on practical applications. Selected products are discussed to illustrate the characteristics of the different technologies. This is an ideal source for anyone who needs a broad perspective on heterogeneous database integration and related technologies.
