A. Hurst, Joseph Albert Cartwright

Physical Geology of Shallow Magmatic Systems Christoph Breitzkreuz, Sergio Rocchi, 2018-03-23 This book offers a high-level summary of shallow magmatic systems (dykes, sills and laccoliths) to support geoscience master and PhD students, scientists and practicing professionals. The product of the LASI (Laccoliths and Sills conference) workshop, it comprises thematic sections written by one or more experts on the respective field. It features reviews concerning the physical properties of magma, geotectonic settings, and the structure of subvolcanic systems, as well as case studies on the best-known systems. The book provides readers a broad and comprehensive understanding of the subvolcanic perspective on pluton growth, which is relevant for mineralogical processes as well as the genesis of mineral deposits.

The Geology of the Great Whin Sill John LEE (Geologist.), 1901

Structure and Emplacement of High-level Magmatic Systems Kenneth Thomson, Nick Petford, 2008 There are continual rounds of annual conferences, special sessions and other symposia that provide ample opportunity for researchers to convene and discuss igneous processes. However, the origin of laccoliths and sills continue to inspire and confound geologists. In one sense, this is surprising. After all, don't we know all we need to know about these rocks by now? As testified by the diverse range of topics covered in this volume, the answer is clearly 'no'. This book contains contributions on physical geology, igneous petrology, volcanology, structural geology, crustal mechanics and geophysics that cover the entire gambit of geological processes associated with the shallow emplacement of magma. High-level intrusions in sedimentary basins can also act as hydrocarbon reservoirs and as sources for thermal maturation. In drawing together a diversity of perspectives on the emplacement of sills, laccoliths and dykes we hope to advance further our understanding of their behaviour.

Petrology and Economic Geology of the Dumont Sill J. M. Duke, 1986 The Dumont Sill, a differentiated ultramafic to mafic sill of Archean age in the Abitibi greenstone belt of the Superior Province, Canadian shield, was first reported in 1925. Over the last 60 years the intrusion has been the focus of limited and largely unsuccessful prospecting for asbestos, base metals and precious metals. Exploration carried out between 1969 and 1972, however, resulted in the discovery of an extensive zone of low grade nickel mineralization within the sill. Although this mineralization has not yet proved to be an economically viable ore deposit, it is a significant nickel resource. This report describes the mineralogy, petrology, and economic geology of the Dumont intrusion, with particular emphasis on the magmatic stage of its development.

The Palisades Sill & Watchung Mountains William a Szary, 2019-11-25 The Palisades Sill & Watchung Mountains of New Jersey and New York reflect rifting of the Pangea supercontinent from Laurentia during the Triassic Period. This booklet offers an introduction to the Palisades Sill along with its geochemical signatures which reveal the sill's plume source and geological history. Part I presents the Palisades Sill offering a discussion of the geologic history, trace element geochemistry, and discussion of the plume source for the sill's emplacement. The Watchung Mountains consists of three mountain ranges paralleling each other in northern New Jersey forming coincidental with the Palisades Sill. Geologic setting of the Watchung Basalt flows, glaciation, structure, stratigraphy of the adjacent rocks, and igneous activity are presented in Part II of this booklet. Part II discusses the Watchung Mountains and its geologic setting, glaciation, stratigraphy, and geologic age, upper Triassic eruptions in New Jersey, igneous activity and its geologic age, regional and local stratigraphic relations, nature and products of basaltic eruptions including sites of fissures, pre-eruptive character of the Newark Basin graben, surface character of the vesicular traps, and geologic processes of jointing systems. Part II finishes out with petrochemistry, megascopic characteristics of the basalt, characterization of pristine gases, history of tectonic subsidence and volcanism in the Newark Basin, structure of the Newark Basin at the close of the Triassic and post Triassic deformation, Triassic tensional

history, and supplementary topics discussing bubble formation processes.

Petrography, Classification and Chronology of Mafic Sill Intrusions Beneath the Eastern Bushveld Complex M. R. Sharpe, 1984

Linking Sill Morphology to Emplacement Mechanisms Nick Schofield (Lecturer in geology), 2009 Mafic sill complexes are increasingly being shown to play a major role in the movement of magma around the upper crust in volcanic terranes and to have a role in mass extinction events in Earth history. Most of the current models of sill emplacement assume that brittle fracture operates at all points of sill emplacement. Within this thesis, a series of observations are presented from sheet intrusions in South Africa, USA and the UK showing that in certain situations, dependent on host rock lithology, the propagation of magma through normal brittle fracture can cease. In this circumstance a prevalent fluid/fluid or fluid/ductile relationship between host rock and intruding magma is often developed. Once this occurs, the evolution of a given sheet intrusion becomes distinctly different from that produced by normal brittle fracture alone. The break down in brittle fracture often leads to the development of magma fingers, which accelerate ahead of the main sheet of magma. It is important to note that it is ultimately the host rock lithology and its coupled response to intrusion of magma that dictates the ongoing evolution of the morphology of sheet intrusions in high-level magmatic systems.
