Encyclopedia of Biodiversity 2013-02-05 The 7-volume Encyclopedia of Biodiversity, Second Edition maintains the reputation of the highly regarded original, presenting the most current information available in this globally crucial area of research and study. It brings together the dimensions of biodiversity and examines both the services it provides and the measures to protect it. Major themes of the work include the evolution of biodiversity, systems for classifying and defining biodiversity, ecological patterns and theories of biodiversity, and an assessment of contemporary patterns and trends in biodiversity. The science of biodiversity has become the science of our future. It is an interdisciplinary field spanning areas of both physical and life sciences. Our awareness of the loss of biodiversity has brought a long overdue appreciation of the magnitude of this loss and a determination to develop the tools to protect our future. Second edition includes over 100 new articles and 226 updated articles covering this multidisciplinary field—from evolution to habits to economics, in 7 volumes The editors of this edition are all well respected, instantly recognizable academics operating at the top of their respective fields in biodiversity research; readers can be assured that they are reading material that has been meticulously checked and reviewed by experts Approximately 1,800 figures and 350 tables complement the text, and more than 3,000 glossary entries explain key terms

The Role of Environmental Heterogeneity in Shaping Biodiversity-ecosystem Function Relationships Matthew Adam Whalen 2017

From global-scale variation in the distribution of light reaching the Earth's surface to the smallest chemical gradients, environmental heterogeneity, or variation in environmental conditions over space and time, is critical to explain process and pattern in nature. Environmental heterogeneity has long been hypothesized to promote species coexistence by allowing niche partitioning. Organisms respond to heterogeneity in abiotic environmental conditions at several scales, interactions between organisms can be mediated by heterogeneity, and organisms themselves can generate additional heterogeneity that may be important for the structure of communities. Importantly, how environmental heterogeneity interacts with biodiversity remains an important challenge to predicting the ecosystem functioning. Moreover, given that environmental conditions and ecological process change across scales of space and time, investigating how heterogeneity influences ecological communities - both directly by modifying habitat quality and indirectly by modifying interactions - across a range of scales is necessary if we want to make predictions in community ecology. Ecologists often observe and measure communities at a single scale, which often not the scale at which processes take place, so defining appropriate scales for inquiry can be challenging. If a single scale is chosen, ecologists must consider the natural history of their systems that relate to the patterns and processes being investigated. However, the ability of ecologists to view systems at several scales at once is improving with technological advances. My goal with this

dissertation was to take what we already know about biodiversity maintenance and ecosystem functioning and extend it to multiple trophic levels, habitats, and scales of observation, all of which are important to our general understanding of community ecology. The real world is messy, which makes the job of a community ecologist simultaneously fascinating and frustrating. However, by considering some of the complexities inherent in natural systems (including how they might change across scale) I aim to help in pushing biodiversity science into the 21st Century. All of the following chapters explore some aspect of environmental heterogeneity and how it either influences biodiversity or interacts with it to determine some important ecological process. Chapter 1 explores temporal variation in a major environmental gradient in marine habitats, water flow, and how it interacts with species diversity of suspension feeding invertebrates to predict community-wide water filtration. I manipulated species diversity of suspension feeders and the presence of water flow directly in the lab and allowed communities to consume a diverse mélange of phytoplankton. By tracking chlorophyll a concentrations over time, I was able to get a proxy for water filtration taking place at the community-level. Species diversity enhanced community filtration, and this response did not depend on whether water was flowing or not. However, individual species and pairs did respond to flow, so these results suggest that interactions between organisms and their modification of water flow may be important for predicting food delivery and ultimately water filtration over time. The balance of competition and niche complementarity appeared to change across flow regimes, which brings species interactions, and their sensitivity to environmental conditions, to the forefront. Chapter 2 investigates a common form of spatial heterogeneity on a rocky shore, namely topography generated by space-holding barnacles and how it interacts with grazer species diversity to drive algal community succession. This chapter was part of a project started by Kristin Aquilino in which we

simultaneously manipulated barnacle cover and snail grazer diversity at small scales relevant to seaweed-grazer interactions. Then we tracked communities over time as they recovered from algal clearing. The presence and heterogeneity of barnacles along with the diversity and identity of grazing invertebrates interacted to predict algal succession. Grazer diversity itself was important for suppressing early successional microalgae, while later successional macroalgae were promoted by the presence of a key limpet grazer. In the absence of this limpet heterogeneity in barnacle cover led to increased algal accumulation. Again, species interactions and the potential for niche complementarity depended on habitat heterogeneity, thus the influence of environment on interactions remains strong thread in the dissertation. Chapter 3 also considers topographic heterogeneity on rocky shores, but this time focusing on how topography at different spatial scales modifies community structure during early succession. We have known for a long time that large elevation gradients on rocky shores are critical for the distributions of organisms, but perhaps small scale environmental variation also matters for these communities as suggested by many previous studies. I decided to manipulate small-scale (mm) topography by making settlement plates that mimicked real rock surfaces. Then I placed these plates across areas of mid-intertidal a rocky shore, which represented larger scale (cm to m) variation in topography, including differences in elevation and distance to shore. Importantly, both scales of environmental heterogeneity influenced community composition, but in different ways. Early successional algae responded more strongly to the large-scale heterogeneity present along and across the coastline, while mobile invertebrates responded strongly to small-scale characteristics like rugosity and convexity. It is likely then that small-scale heterogeneity can have a driving influence on algal distributions indirectly through the grazing behaviors of invertebrate animals, but once again this will depend on the traits

of the grazers (e.g., body size) and how they interact with heterogeneity. One conceptual result that helps tie all of these chapters together is that in order for environmental heterogeneity to be important to ecological communities, the scale at which heterogeneity occurs must match response and effect traits of the organisms living within the community. Body size and the way organisms of a particular size respond to, and potentially modify, their abiotic surroundings play a role in every chapter, from the fouling invertebrates that emerge from the substrate into flowing water (Chapter 1) to the tidepool invertebrates that crawl on bumpy substrates in search of food and refuge (Chapters 2, 3). All of this work, I hope, will help advance ecological knowledge and our collective ability to make predictions in a changing world. Yet, it is likely that the work presented here will generate more questions than answers. For instance, how do we take the ideas laid out in this dissertation and marry them with life histories, which often cause organisms to experience very different scales of environmental heterogeneity over their lifetimes? If we want to make large-scale predictions about the abundance and distribution of life on Earth and how it responds to environmental change, how much information do we actually need to know at the small scales? Give that body size is important for metabolic rates and impacts on ecosystems, might there be ways to combine scaling and metabolic theories in ecology, which strive for simplicity, with the messier information about environmental heterogeneity and species traits to make predictions across different types of ecosystems? These are the types of questions that continue to motivate me and that, hopefully, motivates the field of ecology in the future.

Learning (CSCL) conference has become an internationally-recognized forum for the exchange of research findings related to learning in the context of collaborative activity and the exploration of how such learning might be augmented through technology. This text is the proceedings from CSCL 2005 held in Taipei, Taiwan. This conference marked the 10th anniversary of the first CSCL Conference held at Indiana University in 1995. Subsequent meetings have been held at the University of Toronto, Stanford University, University of Maastricht (Netherlands), University of Colorado at Boulder, and the University of Bergen (Norway). Just as the first CSCL conference was instrumental in shaping the trajectory of the field in its first decade, the conference in Taipei will play an important role in consolidating an increasingly international and interdisciplinary community and defining the direction of the field for the next 10 years. This volume, and the papers from which it is comprised, will be an important resource for those active in this area of research and for others interested in fostering learning in settings of collaboration.

over 80 percent of all life on Earth, the ocean is the world's largest carbon sink and a key source of food and economic security for billions of people. The relevance of the ocean for humanity's future is undisputed. However, the ocean's great potential to drive economic growth and equitable job creation, sustain healthy ecosystems, and mitigate climate change is not yet fully recognised. Lack of awareness of this potential as well as management and governance challenges pose impediments. Until these impediments are removed, ocean ecosystems will continue to be degraded and opportunities for people lost. A transition and a clear path to a thriving and vibrant relationship between humans and the ocean are urgently needed. This open access collection of papers and reports identifies a path that is inspired by science, energised by engaged people, and emboldened by visionary leaders. These assessments of knowledge are commissioned by the High Level Panel for a Sustainable Ocean Economy (Ocean Panel), which was established in September 2018 as a unique initiative led by heads of state and government from around the world, to showcase the latest leading-edge science, knowledge and state-of-the-art thinking on key ocean issues. Altogether, The Blue Compendium offers innovative ocean solutions in technology, policy, governance, and finance realms, that could help accelerate a transition to a more sustainable and prosperous relationship with the ocean. The comprehensive assessments have already informed policy making at the highest levels of government and motivated an impressive array of responsive and ambitious action across a growing network of leaders in business, finance and civil society.

Enter the Alternative School Alia R. Tyner-Mullings 2015-11-17

Enter the Alternative School is an in-depth examination of public school alternatives to traditional educational models in the US. This book analyses how urban education can respond to a system growing increasingly standardised and privatised. As an example, Central Park East Secondary School (CPESS), a public alternative schooling model, successfully served predominantly low-income and minority students. It also changed the New York City public school system while promoting methods that allowed educational institutions to make changes in the lives of their students. Written by a sociologist who was both a student at CPESS and a teacher at a school developed from the CPESS model, the book analyses education from a range of vantage points, assesses outcomes, and invites readers to consider the potential of alternative educational models to address the challenges of reforms that attempt to provide quality education to the low-income and minority students otherwise under served by public schools.

Sustainable Agriculture Reviews Eric Lichtfouse 2013-02-12
Sustainable agriculture is a rapidly growing field aiming at producing food and energy in a sustainable way for humans and their children. Sustainable agriculture is a discipline that addresses current issues such as climate change, increasing food and fuel prices, poor-nation starvation, rich-nation obesity, water pollution, soil erosion, fertility loss, pest control, and biodiversity depletion. Novel solutions are proposed based on integrated knowledge from sciences as diverse as agronomy, soil science, molecular biology, chemistry, toxicology, ecology, economy, philosophy and social sciences. Because actual society issues are now intertwined, global, and fast-developing, sustainable agriculture will bring solutions to build a safer world. This book series gathers review articles that analyze current agricultural issues and knowledge, then propose alternative solutions. It will therefore help all scientists, decision-makers, professors, farmers and politicians who wish to build a safe agriculture, energy and food system for future generations.

Wild Immunology—The Answers Are Out There Gregory M.

Woods 2019-03-20 “Go into partnership with nature; she does more than half the work and asks none of the fee.” - Martin H. Fisher. Nature has undertaken an immense amount of work throughout evolution. The evolutionary process has provided a power of information that can address key questions such as - Which immune molecules and pathways are conserved across

species? Which molecules and pathways are exploited by pathogens to cause disease? What methods can be broadly used or readily adapted for wild immunology? How does co-infection and exposure to a dynamic environment affect immunity? Section 1 addresses these questions through an evolutionary approach. Laboratory mice have been instrumental in dissecting the nuances of the immune system. The first paper investigates the immunology of wild mice and reviews how evolution and ecology sculpt differences in the immune responses of wild mice and laboratory mice. A better understanding of wild immunology is required and sets the scene for the subsequent papers. Although nature doesn't ask for a fee, it is appropriate that nature is repaid in one form or another. The translational theme of the second section incorporates papers that translate wild immunology back to nature. But any non-human, non-laboratory mouse research environment is hindered by a lack of research tools, hence the underlying theme throughout the second section. Physiological resource allocation is carefully balanced according to the most important needs of the body. Tissue homeostasis can involve trade-offs between energy requirements of the host and compensatory mechanisms to respond to infection. The third section comprises a collection of papers that employ novel strategies to understand how the immune system is compensated under challenging physiological situations. Technology has provided substantial advances in understanding the immune system at cellular and molecular levels. The specificity of these tools (e.g. monoclonal antibodies) often limits the study to a specific species or strain. A consequence of similar genetic sequences or cross-reactivity is that the technology can be adapted to wild species. Section 4 provides two examples of probing wild immunology by adapting technology developed for laboratory species.
